**Abstract.** This paper introduces a wide-spectrum specification logic  $\nu Z$ . The minimal core logic is extended to a more expressive specification logic which includes a schema calculus similar (but not equivalent) to  $Z$ , some new additional schema operators and extensions to a programming and program development logic.

## 1. Introduction

In this paper we introduce a wide-spectrum logic  $\nu Z$ . This is a very small specification logic based on a total correctness relational semantics with refinement as its fundamental relation.

The language which underlies the logic is  $Z$ -like, that is to say, we have schemas and schema operators. A significant difference is that operation schemas have two predicates, so resemble more the specification statements of the Refinement Calculus (*e.g.* [6] and [28]) or designs of the UTP [24]. This is, in fact, a fairly trivial difference, and the language could easily be set up using single predicate schemas, if preferred. On the other hand, there are several significant differences between  $\nu Z$  and  $Z$ :

- $Z$  is based on a *partial*-correctness semantics;  $\nu Z$  is based on a *total*-correctness semantics.
- $Z$  permits refinement of over-specifications;  $\nu Z$  does not.
- $Z$  schema operators are not monotonic;  $\nu Z$  schema operators are monotonic (anti-monotonic).
- $Z$  is based on *equality*;  $\nu Z$  is based on *refinement*.
- $Z$  is a *specification* language;  $\nu Z$  is *wide-spectrum*.
- $Z$  is relatively inflexible;  $\nu Z$  is extensible.
- $Z$  is a *language*;  $\nu Z$  is a *logic*.

$\nu Z$  is very economical and expressive: the core language is very small but capable of further development by definition. After we introduce the theory itself, we go on in the sections that follow to introduce a more expressive specification language (specification of specification constructs in  $\nu Z$ ) and then a programming language (specification of programming constructs in  $\nu Z$ ). None of these constructs are fixed; it is possible to provide alternative specification infrastructure and indeed alternative programming languages. Because  $\nu Z$  is a logic, the various definitions, for specification and programming, inherit this and so we induce an extended specification logic and a programming logic alongside the definitions. These combine to form a mathematical framework for the derivation of programs from specification.

In this paper we will concentrate entirely on the system itself, its mathematical basis, and on methodologies for extending the core framework with additional features for specification, for programming and for program development. In future publications we will explore more pragmatic issues, providing techniques and examples to demonstrate how to effectively specify, refine and implement systems within  $\nu Z$ .

## 2. Core $\nu Z$

$\nu Z$  is interpreted within the logic  $\mathcal{Z}_C^\perp$ , the extension of  $\mathcal{Z}_C$  introduced in [20] which includes  $\perp$  elements in all types. We assume familiarity with this theory (and notational conventions); all this is also covered in [23].

### 2.1. Syntax of $\nu Z$

The syntax of the core  $\nu Z$  framework is minimal. The type of an *operation schema*,  $U$ , is  $\mathbb{P} T$  (written  $U^{\mathbb{P} T}$ ) where  $T$  is a schema type which has the form  $V \vee V'$ . Generally we will, as is usual in  $Z$ , write  $\Delta V$  for  $V \vee V'$ . We will write  $U(v)$  to indicate that variable  $v$  may appear free in the schema expression  $U$ .<sup>1</sup>

#### Definition 2.1.

$$\begin{array}{ll}
 U^{\mathbb{P} T} ::= & \\
 & X^{\mathbb{P} T} \quad \text{-- schema variable} \\
 & [ T \mid P \mid Q ] \quad \text{-- atomic specifications} \\
 & \neg U^{\mathbb{P} T} \quad \text{-- negation} \\
 & U_0^{\mathbb{P} T_0} \vee U_1^{\mathbb{P} T_1} \quad (T = T_0 \vee T_1) \quad \text{-- disjunction} \\
 & \exists \mathbf{x}^{T_x} \bullet U_0^{\mathbb{P} T_0} \quad (T = T_0 - T_x) \quad \text{-- existential hiding} \\
 & \mu X^{\mathbb{P} T} \bullet U(X)^{\mathbb{P} T} \quad \text{-- recursive schemas}
 \end{array}$$

### 2.2. Semantics of $\nu Z$

We first need to define refinement. In this framework it is simply containment.

#### Definition 2.2.

$$U_0^{\mathbb{P} T} \supseteq U_1^{\mathbb{P} T} =_{df} \llbracket U_0 \rrbracket \subseteq_T \llbracket U_1 \rrbracket$$

We also need to specify the universe of specification models for a given type. Part (ii) is based on [11] section 8.1.

#### Definition 2.3.

$$\begin{array}{ll}
 (i) \quad \text{magic}^{\mathbb{P} T} & =_{df} [ T \mid \text{true} \mid \text{false} ] \\
 (ii) \quad W_T & =_{df} \{ \llbracket U^{\mathbb{P} T} \rrbracket \mid \text{magic}^{\mathbb{P} T} \supseteq U \wedge U \circ \text{magic}^{\mathbb{P}(\Delta T^{out})} \supseteq U \}
 \end{array}$$

Now we have the semantics of specifications.

**Definition 2.4.** In what follows,  $T^\star =_{df} V_\perp \star V'_\perp$ . The types are omitted here, but are taken to be as specified in the syntax above.

$$\begin{array}{ll}
 \llbracket X \rrbracket & =_{df} X \\
 \llbracket [ T \mid P \mid Q ] \rrbracket & =_{df} \{ z_0 \star z'_1 \in T^\star \mid z_0.P \Rightarrow z_0.z'_1.Q \} \\
 \llbracket \neg U \rrbracket & =_{df} \{ z \in T^\star \mid z = \nu \perp \vee z \notin U \} \\
 \llbracket U_0 \vee U_1 \rrbracket & =_{df} \{ z \in T^\star \mid z \in \llbracket U_0 \rrbracket \vee z \in \llbracket U_1 \rrbracket \} \\
 \llbracket \exists \mathbf{x} \bullet U_0 \rrbracket & =_{df} \{ z \in T^\star \mid \exists y \in T_0^\star \bullet y \in \llbracket U_0 \rrbracket \wedge z = y \uparrow T \} \\
 \llbracket \mu X \bullet U(X) \rrbracket & =_{df} \bigcap \{ X \in W_T \mid \llbracket U(X) \rrbracket \supseteq X \}
 \end{array}$$

In the case of recursion, the schema variable  $X$  must appear in a *positive* position in  $U$ . That is: this is monotone recursion. The notation  $t.P$  indicates the usual distribution of the binding  $t$  through the proposition  $P$  so that its component observations  $\mathbf{x}$  are replaced by  $t.x$ . Note that  $\perp.P = \text{false}$  for all  $P$  ( $\perp$  satisfies nothing, in particular it is outside every precondition). Since types can be recovered from the alphabets of  $P$  and  $Q$  for atomic schemas, we can and will write  $[ P \mid Q ]$  for  $[ T \mid P \mid Q ]$  in the sequel (and suppress types) where possible.

<sup>1</sup> When the variable has the type  $\mathbb{P} T$  and  $T$  is a schema type (that is: it is a variable over schemas) we shall write it in  $\mathcal{Z}_C^\perp$ , as we do in  $\nu Z$ , in upper-case.

### 2.3. Logic of $\nu Z$

The semantics induces a logic for the constructs, as follows. In this introductory paper we omit the proofs.

#### 2.3.1. Refinement

The rules for operation refinement in  $\nu Z$  are as follows:

**Proposition 2.1.** Let  $z$  be a fresh variable.

$$\frac{z \in U_0 \vdash z \in U_1}{U_0 \sqsupseteq U_1} (\sqsupseteq^+) \quad \frac{U_0 \sqsupseteq U_1 \quad t \in U_0}{t \in U_1} (\sqsupseteq^-)$$

□

#### 2.3.2. Atomic Operation Schemas

The rules for atomic operation schema in  $\nu Z$  are as follows:

**Proposition 2.2.**

$$\frac{t_0.P \vdash t_0.t'_1.Q}{t_0 \star t'_1 \in [P \mid Q]} (U^+) \quad \frac{t_0 \star t'_1 \in [P \mid Q] \quad t_0.P}{t_0.t'_1.Q} (U^-)$$

□

The following inequations are derivable:

**Proposition 2.3.** Weakening of preconditions and strengthening of postconditions (respectively):

$$\frac{t.P_1 \vdash t.P_0}{[P_0 \mid Q] \sqsupseteq [P_1 \mid Q]} \quad \frac{t.Q_0 \vdash t.Q_1}{[P \mid Q_0] \sqsupseteq [P \mid Q_1]}$$

□

#### 2.3.3. Negated Schemas

Note that negation in  $\nu Z$  is not the relational complement: it is well-known that the universe of total-correctness relations in this model is not closed under that operation (see *e.g.* [11]). An alternative characterisation of the semantics is available using a combination of relational complement, disjunction and magic.

**Definition 2.5.**

$$\neg U = \overline{U} \vee \text{magic}$$

In any event, the rules for negation are derivable:

**Proposition 2.4.**

$$\frac{t \notin U}{t \in \neg U} (U_{\neg_0}^+) \quad \frac{t \in \text{magic}}{t \in \neg U} (U_{\neg_1}^+) \quad \frac{t \in \neg U \quad t \notin U \vdash P \quad t \in \text{magic} \vdash P}{P} (U_{\neg_2}^-)$$

□

Negated schemas are *anti-monotonic* with respect to the refinement relation:

**Proposition 2.5.**

$$\frac{U_1 \sqsupseteq U_0}{\neg U_0 \sqsupseteq \neg U_1}$$

□

The notion satisfies double negation and excluded middle.

**Proposition 2.6.**

$$\frac{t \in U}{t \in \neg\neg U} \quad \frac{t \in \neg\neg U}{t \in U} \quad \frac{}{t \in \neg U \vee U}$$

□

### 2.3.4. Disjunction Schemas

The rules for disjunction schemas in  $\nu Z$  are derivable, as follows:

**Proposition 2.7.** Let  $i \in 2$ .

$$\frac{t \in U_i}{t \in U_0 \vee U_1} (U_{\vee_i}^+) \quad \frac{t \in U_0 \vee U_1 \quad t \in U_0 \vdash P \quad t \in U_1 \vdash P}{P} (U_{\vee}^-)$$

□

Disjunction schemas are *monotonic* with respect to the refinement relation:

**Proposition 2.8.**

$$\frac{U_0 \sqsupseteq U_2 \quad U_1 \sqsupseteq U_3}{U_0 \vee U_1 \sqsupseteq U_2 \vee U_3}$$

□

The inequational refinement logic of disjunction schemas:

**Proposition 2.9.**

$$[P_0 \mid Q_0] \vee [P_1 \mid Q_1] \sqsupseteq [P_0 \wedge P_1 \mid Q_0 \vee Q_1]$$

□

**Proposition 2.10.**

$$[P_0 \vee P_1 \mid Q_0 \wedge Q_1] \sqsupseteq [P_0 \mid Q_0] \vee [P_1 \mid Q_1]$$

□

### 2.3.5. Existential Hiding Schemas

The rules for existential hiding schemas in  $\nu Z$  are derivable, as follows:

**Proposition 2.11.**

$$\frac{t \in U}{t \in \exists \mathbf{x} \bullet U} (U_{\exists}^+) \quad \frac{t \star \langle \mathbf{x} \Rightarrow y \rangle \in U \vdash P}{P} (U_{\exists}^-)$$

□

The rule for existential hiding involves *binding extension* which is closely connected to binding substitution and to a lemma which will be required extensively in the proofs of the refinement inequations that follow. First we have the definition of substitution for a binding  $t_0$ .

**Definition 2.6.**

$$t_0[\mathbf{x}_0/t_1].\mathbf{x}_1 =_{df} \begin{cases} t_1 & \text{when } \mathbf{x}_0 = \mathbf{x}_1 \\ t_0.\mathbf{x}_1 & \text{otherwise} \end{cases}$$

We employ the notation  $b.P$  and  $b.t$  (generalising binding selection) adapted from [33]. Suppose that  $\{z_0 \cdots z_n\}$  is the alphabet set of  $t$ , then  $t.P$  is  $P[z_0 \cdots z_n/t.z_0 \cdots t.z_n]$ .

**Lemma 2.12.**

$$t_0[\mathbf{x}/t_0.t_1].P = t_0.P[\mathbf{x}/t_1]$$

**Proof** By induction on the structure of propositions and terms.

□

In view of this, it is possible to express the existential elimination rule as:

$$\frac{t \in \exists \mathbf{x} \bullet U \quad t[\mathbf{x}/y] \in U \vdash P}{P} (U_{\exists})$$

Existential hiding schemas are *monotonic* with respect to the refinement relation:

**Proposition 2.13.**

$$\frac{U_0 \sqsupseteq U_1}{\exists \mathbf{x} \bullet U_0 \sqsupseteq \exists \mathbf{x} \bullet U_1}$$

□

There are inequations for refinement involving existential hiding. First, when hiding a before observation:

**Proposition 2.14.**

$$\exists \mathbf{x} \bullet [P \mid Q] \sqsupseteq [\forall u \bullet P[\mathbf{x}/u] \mid \exists u \bullet Q[\mathbf{x}/u]]$$

**Proof**

$$\begin{array}{c} \frac{\frac{\frac{z_0 \star \langle \mathbf{x} \Rightarrow y \rangle \star z'_1 \in [P \mid Q]}{z_0[\mathbf{x}/y] \star z'_1 \in [P \mid Q]} \quad (2) \quad \frac{\frac{\forall u \bullet z_0.P[\mathbf{x}/u]}{z_0.P[\mathbf{x}/y]} \quad (1)}{z_0[\mathbf{x}/y].P}}{z_0[\mathbf{x}/y].z'_1.Q} \quad (0)}{z_0.z'_1.Q[\mathbf{x}/y]} \quad (2)}{\frac{\frac{z_0 \star z'_1 \in \exists \mathbf{x} \bullet [P \mid Q]}{\exists u \bullet z_0.z'_1.Q[\mathbf{x}/u]} \quad (0)}{\exists u \bullet z_0.z'_1.Q[\mathbf{x}/u]} \quad (1)}{\frac{z_0 \star z'_1 \in [\forall u \bullet P[\mathbf{x}/u] \mid \exists u \bullet Q[\mathbf{x}/u]]}{\exists \mathbf{x} \bullet [P \mid Q] \sqsupseteq [\forall u \bullet P[\mathbf{x}/u] \mid \exists u \bullet Q[\mathbf{x}/u]]} \quad (0)} \end{array}$$

□

Second, when hiding an after observation:

**Proposition 2.15.**

$$\exists \mathbf{x}' \bullet [P \mid Q] \sqsupseteq [P \mid \exists v \bullet Q[\mathbf{x}'/v]]$$

**Proof**

$$\begin{array}{c} \frac{\frac{\frac{z_0 \star z'_1 \star \langle \mathbf{x}' \Rightarrow w \rangle \in [P \mid Q]}{z_0 \star z'_1[\mathbf{x}'/w] \in [P \mid Q]} \quad (2) \quad \frac{z_0.P}{z_0.P} \quad (1)}{z_0.z'_1[\mathbf{x}'/w].Q} \quad (0)}{z_0.z'_1.Q[\mathbf{x}'/w]} \quad (2)}{\frac{\frac{z_0 \star z'_1 \in \exists \mathbf{x}' \bullet [P \mid Q]}{\exists v \bullet z_0.z'_1.Q[\mathbf{x}'/v]} \quad (0)}{\exists v \bullet z_0.z'_1.Q[\mathbf{x}'/v]} \quad (1)}{\frac{z_0 \star z'_1 \in [P \mid \exists v \bullet Q[\mathbf{x}'/v]]}{\exists \mathbf{x}' \bullet [P \mid Q] \sqsupseteq [P \mid \exists v \bullet Q[\mathbf{x}'/v]]} \quad (0)} \end{array}$$

□

And now, in the other direction:

**Proposition 2.16.**

$$[\exists u \bullet P[\mathbf{x}/u] \mid \forall u \bullet Q[\mathbf{x}/u]] \sqsupseteq \exists \mathbf{x} \bullet [P \mid Q]$$

$Z$ , which we will see have some use when we turn to the topic of programming languages and program development logics in later sections.

### 3.1. Conjunction Schemas

We can define schema conjunction in terms of disjunction and negation, using the usual de Morgan definitions. We omit the proofs, which are a little more involved than usual, due to the more complex notion of negation we are obliged to use.

**Definition 3.1.**

$$U_0 \wedge U_1 =_{df} \neg(\neg U_0 \vee \neg U_1)$$

The usual rules are derivable.

**Proposition 3.1.** Let  $i \in 2$ .

$$\frac{t \in U_0 \quad t \in U_1}{t \in U_0 \wedge U_1} (U_{\wedge}^+) \quad \frac{t \in U_0 \wedge U_1}{t \in U_i} (U_{\wedge}^-)$$

□

Conjunction schemas are *monotonic* with respect to the refinement relation:

**Proposition 3.2.**

$$\frac{U_0 \sqsupseteq U_2 \quad U_1 \sqsupseteq U_3}{U_0 \wedge U_1 \sqsupseteq U_2 \wedge U_3}$$

□

The inequational refinement logic of conjunction schemas:

**Proposition 3.3.**

$$[P_0 \mid Q_0] \wedge [P_1 \mid Q_1] \sqsupseteq [P_0 \wedge P_1 \mid Q_0 \wedge Q_1]$$

□

**Proposition 3.4.**

$$[P_0 \mid Q_0] \wedge [P_1 \mid Q_1] \sqsupseteq [P_0 \vee P_1 \mid Q_0 \vee Q_1]$$

□

**Proposition 3.5.**

$$[P_0 \vee P_1 \mid Q_0 \wedge Q_1] \sqsupseteq [P_0 \mid Q_0] \wedge [P_1 \mid Q_1]$$

□

### 3.2. Implication Schemas

We can define schema implication in terms of disjunction and negation, using the usual de Morgan definitions.

**Definition 3.2.**

$$U_0 \Rightarrow U_1 =_{df} \neg U_0 \vee U_1$$

With the obvious rules derivable:

**Proposition 3.6.**

$$\frac{z \in U_0 \vdash z \in U_1}{z \in U_0 \Rightarrow U_1} (U_{\Rightarrow}^+) \quad \frac{t \in U_0 \Rightarrow U_1 \quad t \in U_0}{t \in U_1} (U_{\Rightarrow}^-)$$

□

Schema implication is *monotonic* on the right, and *anti-monotonic* on the left with respect to the refinement relation:

**Proposition 3.7.**

$$\frac{U_2 \sqsupseteq U_0 \quad U_1 \sqsupseteq U_3}{U_0 \Rightarrow U_1 \sqsupseteq U_2 \Rightarrow U_3}$$

□

The inequational refinement logic of schema implication:

**Proposition 3.8.**

$$[P_0 \mid Q_0] \Rightarrow [P_1 \mid Q_1] \sqsupseteq [P_0 \wedge P_1 \mid Q_0 \Rightarrow Q_1]$$

□

**Proposition 3.9.**

$$[P_0 \Rightarrow P_1 \mid Q_0 \wedge Q_1] \sqsupseteq [P_0 \mid Q_0] \Rightarrow [P_1 \mid Q_1]$$

□

### 3.3. Universal Hiding Schemas

Universal hiding is defined in terms of existential hiding and negation, using the standard de Morgan definition. We provide the proofs in detail, in this section, for illustration.

**Definition 3.3.**

$$\forall \mathbf{x} \bullet U =_{df} \neg \exists \mathbf{x} \bullet \neg U$$

And then the usual introduction and elimination rules are derivable.

**Proposition 3.10.** Let  $z$  be a fresh variable. We assume that  $t$  has the form  $t_0 \star t'_1$ .

$$\frac{t \star \langle \mathbf{x} \Rightarrow z \rangle \in U}{t \in \forall \mathbf{x} \bullet U}$$

**Proof** Consider the following derivation, which requires the *law of excluded middle*:

$$\frac{\frac{t_0 = \perp \vee t_0 \neq \perp}{t_0 = \perp} \quad \frac{\overline{t_0 = \perp} \quad (0)}{t \in \neg \exists \mathbf{x} \bullet \neg U} \quad \frac{\delta_0 \quad \dots}{t \in \neg \exists \mathbf{x} \bullet \neg U} \quad (0)}{t \in \neg \exists \mathbf{x} \bullet \neg U} \quad (0)$$

where  $\delta_0$  is:

$$\frac{\frac{\overline{t \in \exists \mathbf{x} \bullet \neg U} \quad (1)}{\text{false}} \quad \frac{\delta_1 \quad \dots}{\text{false}} \quad (2)}{\frac{\text{false}}{t \notin \exists \mathbf{x} \bullet \neg U} \quad (1)}{t \in \neg \exists \mathbf{x} \bullet \neg U}$$

and where  $\delta_1$  is:

$$\frac{\frac{\overline{t \star \langle \mathbf{x} \Rightarrow z \rangle \in \neg U} \quad (2)}{\text{false}} \quad \frac{\overline{t \star \langle \mathbf{x} \Rightarrow z \rangle \notin U} \quad (3) \quad \overline{t \star \langle \mathbf{x} \Rightarrow z \rangle \in U}}{\text{false}} \quad \frac{\overline{t_0 = \perp} \quad (3) \quad \overline{t_0 \neq \perp} \quad (0)}{\text{false}} \quad (3)}{\text{false}}$$

□

**Proposition 3.11.** Let  $t$  have the form  $t_0 \star t'_1$ .

$$\frac{t \in \forall \mathbf{x} \bullet U \quad v \in T_{\mathbf{x}}}{t \star \langle \mathbf{x} \Rightarrow v \rangle \in U}$$

**Proof** Consider the following derivation, which requires the *law of excluded middle*:

$$\frac{\overline{t_0 = \perp \vee t_0 \neq \perp} \quad \begin{array}{c} \delta_0 \\ \vdots \\ t \star \langle x \Rightarrow v \rangle \in U \end{array} \quad \begin{array}{c} \delta_1 \\ \vdots \\ t \star \langle x \Rightarrow v \rangle \in U \end{array}}{t \star \langle x \Rightarrow v \rangle \in U} \quad (0)$$

where  $\delta_0$  is:

$$\frac{\frac{\overline{t_0 \star \langle x \Rightarrow v \rangle \notin U} \quad (1)}{t_0 \star \langle x \Rightarrow v \rangle \in \neg U} \quad \frac{\overline{t_0 \star \langle x \Rightarrow v \rangle \in T^*}}{t_0 \star \langle x \Rightarrow v \rangle \in T_{0\perp}} \quad \frac{\overline{t_0 = \perp} \quad (0)}{false} \quad \frac{\frac{\overline{t_0 \in T_0}}{t_0 \neq \perp} \quad (2)}{false} \quad \frac{\frac{\overline{t_0 \star \langle x \Rightarrow v \rangle = \perp} \quad (2)}{\langle x \Rightarrow v \rangle = \perp} \quad \frac{v \in T_x}{v \neq \perp}}{false} \quad (2)}{t \star \langle x \Rightarrow v \rangle \in U} \quad (1)$$

and  $\delta_1$  is:

$$\frac{\frac{\overline{t \star \langle x \Rightarrow v \rangle \notin U} \quad (4)}{t \star \langle x \Rightarrow v \rangle \in \neg U} \quad \frac{\overline{t \in \exists x^{T_x} \bullet \neg U}}{t_0 \neq \perp} \quad (0)}{false} \quad (4)$$

□

Universal hiding schemas are *monotonic* with respect to the refinement relation:

**Proposition 3.12.**

$$\frac{U_0 \sqsupseteq U_1}{\forall x \bullet U_0 \sqsupseteq \forall x \bullet U_1}$$

□

We have an inequational logic of refinement for universal hiding.

First, when hiding a before observation:

**Proposition 3.13.**

$$\forall x \bullet [P \mid Q] \sqsupseteq [\exists u \bullet P[x/u] \mid \exists u \bullet Q[x/u]]$$

**Proof**

$$\frac{\frac{\overline{z_0 \star z'_1 \in \forall u \bullet [P \mid Q]} \quad (0)}{z_0[x/y] \star z'_1 \in [P \mid Q]} \quad \frac{\overline{z_0.P[x/y]}}{z_0[x/y].P} \quad (2)}{\frac{z_0[x/y].z'_1.Q}{z_0.z'_1.Q[x/y]} \quad (1)}{\frac{\overline{\exists u \bullet z_0.P[x/u]} \quad (1)}{\exists u \bullet z_0.z'_1.Q[x/u]} \quad (2)}{\frac{z_0 \star z'_1 \in [\exists u \bullet P[x/u] \mid \exists u \bullet Q[x/u]}{\forall x \bullet [P \mid Q] \sqsupseteq [\exists u \bullet P[x/u] \mid \exists u \bullet Q[x/u]} \quad (0)} \quad (0)$$

□

And:

**Proposition 3.14.**

$$\forall x \bullet [P \mid Q] \sqsupseteq [\forall u \bullet P[x/u] \mid \forall u \bullet Q[x/u]]$$

**Proof**

$$\begin{array}{c}
\frac{z_0 \star z'_1 \in [P \mid \forall v \bullet Q[\mathbf{x}'/v]] \quad (0) \quad \frac{}{z_0.P} \quad (I)}{\frac{\frac{\frac{\forall u \bullet z_0.z'_1.Q[\mathbf{x}'/u]}{z_0.z'_1.Q[\mathbf{x}'/w]} \quad (I)}{z_0.z'_1[\mathbf{x}'/w].Q}}{z_0 \star z'_1[\mathbf{x}'/w] \in [P \mid Q]} \quad (I)}{z_0 \star z'_1 \in \forall \mathbf{x}' \bullet [P \mid Q]} \quad (0)}{[P \mid \forall v \bullet Q[\mathbf{x}'/v]] \sqsupseteq \forall \mathbf{x}' \bullet [P \mid Q]} \quad (0)
\end{array}$$

□

**3.4.  $\Xi$  Schemas**

We have the usual idea of  $\Xi$ -schemas:

**Definition 3.4.**

$$\Xi T =_{df} [\Delta T \mid true \mid \theta T = \theta' T]$$

The rules are straightforward:

**Proposition 3.18.**

$$\frac{}{t \star t' \in \Xi T} \quad \frac{t_0 \star t'_1 \in \Xi T}{t_0 = t_1}$$

□

**3.5. The Skip Extension**

We use this to define the *skip*-extension of a schema:

**Definition 3.5.** When  $T_0$  and  $T_1$  are disjoint, we define:

$$U^{\mathbb{P} T_0} \diamond T_1 =_{df} U \wedge \Xi T_1$$

Naturally this is well-defined even when the types are not disjoint, but the purpose of this is, as described, to extend a schema with *skip* and the definition has pathological effects in other circumstances.

The rules are straightforward:

**Proposition 3.19.**

$$\frac{t_0 \star t'_1 \in U \quad t_0 =_T t_1}{t_0 \star t'_1 \in U \diamond T} \quad (U_{\diamond}^+) \quad \frac{t \in U \diamond T}{t \in U} \quad (U_{\diamond}^-) \quad \frac{t_0 \star t'_1 \in U \diamond T}{t_0 =_T t_1} \quad (U_{\diamond}^-)$$

□

The *skip*-extension is *monotonic* with respect to the refinement relation:

**Proposition 3.20.**

$$\frac{U_0 \sqsupseteq U_1}{U_0 \diamond T \sqsupseteq U_1 \diamond T}$$

□

**3.6. Composition Schemas**

In  $\nu Z$  we wish to compose *arbitrary* specifications; even when the types of the operations do not match. In this regard  $\nu Z$  differs from  $Z$ . For such compositions to make sense, it is necessary to match incompatible types and to ensure that

operations do not arbitrarily adjust bindings in the process. The definition of schema composition in  $\nu Z$  is, therefore, a little more complex than in  $Z$ . Nevertheless, it is possible to specify composition in the core theory, using the `skip`-extension operator.

**Definition 3.6.** Let  $T_L = T_1 - T_0$  with the form  $\Delta T_L = T_L^{in} \vee T_L^{out'}$  and let  $T_R = T_0 - T_1$  with the form  $\Delta T_R = T_R^{in} \vee T_R^{out'}$ . Let  $\bar{c}$  be a vector of fresh observations with the size of the alphabet of  $T_0^{out'} \vee T_L^{out'}$  (equivalently:  $T_1^{in} \vee T_R^{in}$ ).

$$U_0^{\mathbb{P}(T_0^{in} \vee T_0^{out'})} \circ U_1^{\mathbb{P}(T_1^{in} \vee T_1^{out'})} =_{df} \exists \bar{c} \bullet (U_0 \diamond T_L)[\alpha(T_0^{out'} \vee T_L^{out'}) / \bar{c}] \wedge (U_1 \diamond T_R)[\alpha(T_1^{in} \vee T_R^{in}) / \bar{c}]$$

The following introduction and elimination rules are derivable for schema composition:

**Proposition 3.21.**

$$\frac{t_0 \star t'_2 \in U_0 \quad t_0 =_{T_L} t_2 \quad t_2 \star t'_1 \in U_1 \quad t_2 =_{T_R} t_1}{t_0 \star t'_1 \in U_0 \circ U_1} (U_9^+)$$

□

**Proposition 3.22.**

$$\frac{t_0 \star t'_1 \in U_0 \circ U_1 \quad t_0 \star t'_2 \in U_0, t_0 =_{T_L} t_2, t_2 \star t'_1 \in U_1, t_2 =_{T_R} t_1 \vdash P}{P} (U_9^-)$$

□

Composition schemas are *monotonic* with respect to the refinement relation:

**Proposition 3.23.**

$$\frac{U_0 \sqsupseteq U_2 \quad U_1 \sqsupseteq U_3}{U_0 \circ U_1 \sqsupseteq U_2 \circ U_3}$$

□

### 3.7. Restricted Chaos

This definition introduces a restricted form of *chaos*: outside  $P$  this schema blocks.

**Definition 3.7.**

$$chaos_P =_{df} [\neg P \mid false]$$

This leads to the following logical rules.

**Proposition 3.24.**

$$\frac{t_0.P}{t_0 \star t'_1 \in chaos_P} (chaos_P^+) \quad \frac{t_0 \star t'_1 \in chaos_P \quad \neg t_0.P}{false} (chaos_P^-)$$

□

### 3.8. Schema Specialisation

We use restricted chaos to introduce the specialisation of a schema at a particular observation (it blocks elsewhere).

**Definition 3.8.** Let  $E_T$  be the schema type corresponding to the observations contained in  $E$ . Let  $\mathbb{P} T$  be the schema type of  $U$ , and let  $\Delta[x^{T_x}] \leq T$ .

$$U[x \Rightarrow E] =_{df} chaos_{(x=E)} \wedge U$$

This induces the following rules:

**Proposition 3.25.**

$$\frac{t \dot{\in} U \quad t.x = t.E}{t \in U[x \Rightarrow E]} \quad \frac{t \in U[x \Rightarrow E]}{t \dot{\in} U} \quad \frac{t \in U[x \Rightarrow E]}{t.x = t.E}$$

□

Specialisation schemas are *monotonic* with respect to the refinement relation:

**Proposition 3.26.**

$$\frac{U_0 \sqsupseteq U_1}{U_0[x \Rightarrow E] \sqsupseteq U_1[x \Rightarrow E]}$$

□

### 3.9. Strengthening Preconditions

This operator has the effect of (in general) strengthening the precondition of a schema  $U$  by stipulating an additional condition  $P$ .

**Definition 3.9.** Let  $T_P$  be the schema type corresponding to the observations contained in  $P$ . Let  $\mathbb{P} T$  be the schema type of  $U$ , and let  $T_P \leq T$ .

$$U \uparrow P =_{df} \text{chaos}_P \Rightarrow U$$

The operator is governed by induced logical rules.

**Proposition 3.27.**

$$\frac{t.P \vdash t \in U}{t \in U \uparrow P} \quad \frac{t \in U \uparrow P \quad t.P}{t \in U}$$

□

Strengthening preconditions is *monotonic* with respect to the refinement relation:

**Proposition 3.28.**

$$\frac{U_0 \sqsupseteq U_1}{U_0 \uparrow P \sqsupseteq U_1 \uparrow P}$$

□

## 4. Specifying a Programming Language in $\nu Z$

It is central to the methodology of  $\nu Z$  that it smoothly integrates specification and programming, and that it is possible to develop programs from specifications. This is achieved by firstly *specifying* a programming language in  $\nu Z$  and then inducing a corresponding program logic: refinement then automatically permits development from specifications to programs. We will develop such a language incrementally in this section.

### 4.1. Skip

**Definition 4.1.** For any type  $T$ .

$$\text{skip} =_{df} \Xi T$$

Rules for skip:

**Proposition 4.1.**

$$\frac{}{t \star t' \in \text{skip}} \text{ (skip}^+) \quad \frac{t_0 \star t'_1 \in \text{skip}}{t_0 = t_1} \text{ (skip}^-)$$

□

The inequational refinement logic of `skip`:

**Proposition 4.2.**

$$\frac{\theta T = \theta' T \vdash t. Q}{\text{skip} \sqsupseteq [ T \mid \text{true} \mid Q ]}$$

□

## 4.2. Assignment

**Definition 4.2.** Let  $V = T_E - [\mathbf{x}^{T_x}]$

$$\mathbf{x} := E =_{df} [ \text{true} \mid \mathbf{x}' = E ] \wedge \exists V$$

Rules for assignment:

**Proposition 4.3.**

$$\frac{}{t \star t'[\mathbf{x}'/t.E] \in \mathbf{x} := E} (:=^+) \quad \frac{t_0 \star t'_1 \in \mathbf{x} := E}{t_0[\mathbf{x}/t_0.E] = t'_1} (:=^-)$$

□

The inequational refinement logic for assignment:

**Proposition 4.4.** Let  $z$  be fresh.

$$\frac{z.z'[\mathbf{x}'/z.E].Q}{\mathbf{x} := E \sqsupseteq [ \text{true} \mid Q ]}$$

□

## 4.3. Conditional

We define a new operator, a conditional schema, in terms of conjunction and strengthening of preconditions:

**Definition 4.3.** Let  $\mathbb{P} T_0$  and  $\mathbb{P} T_1$  be the schema types of  $U_0$  and  $U_1$  respectively. Let  $T_D \leq T_0 \wedge T_1$ .

$$\text{if } D \text{ then } U_0 \text{ else } U_1 =_{df} U_0 \uparrow D \wedge U_1 \uparrow \neg D$$

Rules for the conditional:

**Proposition 4.5.**

$$\frac{t.D \vdash z \in U_0 \quad \neg t.D \vdash t \in U_1}{t \in \text{if } D \text{ then } U_0 \text{ else } U_1} (\text{if}^+)$$

$$\frac{t \in \text{if } D \text{ then } U_0 \text{ else } U_1 \quad t.D}{t \in U_0} (\text{if}_0^-) \quad \frac{t \in \text{if } D \text{ then } U_0 \text{ else } U_1 \quad t.(\neg D)}{t \in U_1} (\text{if}_1^-)$$

□

Equations and inequations:

**Proposition 4.6.**

$$\text{if } \text{true} \text{ then } U_0 \text{ else } U_1 \doteq U_0$$

**Proof** Follow from specialisations of the introduction rule and the first elimination rule:

$$\frac{\overline{\text{false}} (I)}{z \in U_0 \quad z \in U_1} (I) \quad \frac{}{z \in \text{if } D \text{ then } U_0 \text{ else } U_1} (I)$$

$$\frac{z \in \text{if } D \text{ then } U_0 \text{ else } U_1}{z \in U_0}$$

□

**Proposition 4.7.**

$$\text{if } \text{false} \text{ then } U_0 \text{ else } U_1 \doteq U_1$$

□

**Proposition 4.8.**

$$\text{if } D \text{ then } [P \mid D \wedge Q] \text{ else } [P \mid \neg D \wedge Q] \sqsupseteq [P \mid Q]$$

**Proof** In what follows we write  $\phi$  for

$$z \in \text{if } D \text{ then } [P \mid D \wedge Q] \text{ else } [P \mid \neg D \wedge Q] \sqsupseteq [P \mid Q]$$

$$\frac{\frac{\frac{\overline{z.P} \quad (I)}{z \in [P \mid D \wedge Q]} \quad \frac{\phi \quad \overline{z.D} \quad (2)}{z.(D \wedge Q)}}{z.Q} \quad \frac{\frac{\overline{z.P} \quad (I)}{z \in [P \mid \neg D \wedge Q]} \quad \frac{\phi \quad \overline{z.(\neg D)} \quad (2)}{z.(\neg D \wedge Q)}}{z.Q} \quad (2)}{\frac{z.Q}{z \in [P \mid Q]} \quad (I)} \quad \frac{D \vee \neg D}{z.Q} \quad (2)$$

□

#### 4.4. Cases

The previous section can easily be generalised to case commands. We define a new operator, a case schema, in terms of conjunction and strengthening of preconditions:

**Definition 4.4.** Let  $T = \{\dots c_i \dots\}$ .

$$\text{cases } E^T \text{ in } c_0 : U_0^{\mathbb{P} T_0} \dots c_n : U_n^{\mathbb{P} T_n} \text{ endcases} =_{df} U_0 \uparrow E = c_0 \wedge \dots \wedge U_n \uparrow E = c_n$$

Rules for the cases:

**Proposition 4.9.** Let  $i \in n + 1$ .

$$\frac{\dots t.(E = c_i) \vdash t \in U_i \dots}{t \in \text{cases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endcases}} \quad (\text{cases}^+)$$

$$\frac{t \in \text{cases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endcases} \quad t.(E = c_i)}{t \in U_i} \quad (\text{cases}_i^-)$$

□

Inequation:

**Proposition 4.10.** Let  $T = \{\dots c_i \dots\}$ .

$$\text{cases } E^T \text{ in } c_0 : [T \mid P \mid E = c_0 \wedge Q] \dots c_n : [T \mid P \mid E = c_n \wedge Q] \text{ endcases} \sqsupseteq [T \mid P \mid Q]$$

□

## 4.5. Scope

**Definition 4.5.**

$$\text{begin var } x : T_x ; U \text{ end} =_{df} \exists x, x' \bullet U$$

**Proposition 4.11.**

$$\frac{t \in U}{t \in \text{begin var } x : T_x ; U \text{ end}} \text{ (begin}^+\text{)}$$

$$\frac{t \in \text{begin var } x : T_x ; U \text{ end} \quad t \star \langle x \Rightarrow y_0, x' \Rightarrow y_1 \rangle \in U \vdash P}{P} \text{ (begin}^-\text{)}$$

□

We have refinement inequations for the block:

**Proposition 4.12.**

$$\text{begin var } x ; [ P \mid Q ] \text{ end} \sqsupseteq [ \forall u \bullet P[x/u] \mid \exists u, v \bullet Q[x, x'/u, v] ]$$

**Proof** Follows from propositions 2.14 and 2.15.

□

**Proposition 4.13.**

$$[ \exists u \bullet P[x/u] \mid \forall u, v \bullet Q[x, x/u, v] ] \sqsupseteq \text{begin var } x ; [ P \mid Q ] \text{ end}$$

**Proof** Follows from propositions 2.16 and 2.17.

□

## 4.6. Procedure Call

This and the interpretation of procedures themselves are mutually dependent. Suppose that  $f$  is a procedure (we will see an example in the next section), then procedure call is trivially defined:

**Definition 4.6.**

$$f(E) =_{df} f[x \Rightarrow E]$$

This leads to inference rules:

**Proposition 4.14.**

$$\frac{t \in f \quad t.x = t.E}{t \in f(E)} \quad \frac{t \in f(E)}{t \in f} \quad \frac{t \in f(E)}{t.x = t.E}$$

□

It is necessary to analyse this in advance of procedures themselves, as it is implicated in the definition, as we will now see.

## 4.7. Primitive Recursive Procedures Over Numbers

We define a new schema operator, primitive recursion over the natural numbers, in terms of conjunction, strengthening of preconditions, existential hiding, schema specialisation and recursive schemas.

**Definition 4.7.**

$$\text{proc } f(x) \text{ cases } x \text{ in } 0 : U_0 ; m + 1 : U_1(f(m)) \text{ endcases} =_{df} \\ \mu X \bullet U_0 \uparrow x = 0 \wedge \exists m \bullet U_1(X[x \Rightarrow m]) \uparrow x = m + 1$$

The idea is that  $U_1$  is a schema whose alphabet includes  $m$  and which contains a free schema variable  $X$  whose type is the type of the entire procedure.

And the rules.

**Proposition 4.15.** Introduction:

$$\frac{t.x = 0 \vdash t \in U_0 \quad t.x = t.m + 1 \vdash t \in U_1(f(m))}{t \in f}$$

**Proof**

$$\frac{\frac{\frac{\overline{t.x = 0} \quad (I)}{\vdots} \quad t \in U_0}{t \in U_0 \uparrow x = 0} \quad (I) \quad \frac{\frac{\overline{t.x = t.m + 1} \quad (2)}{\vdots} \quad t \in U_1(f(m))}{t \in U_1(f(m)) \uparrow x = m + 1} \quad (2)}{t \in \exists m \bullet U_1(f(m)) \uparrow x = m + 1} \quad (\mu^+)}{t \in U_0 \uparrow x = 0 \wedge \exists m \bullet U_1(f(m)) \uparrow x = m + 1} \quad (\mu^+)}{t \in f}$$

□

**Proposition 4.16.** Elimination:

$$\frac{t \in f \quad t.x = 0}{t \in U_0} \quad \frac{t \in f \quad t.x = m + 1}{t \in U_1(f(m))}$$

□

In what follows, we write  $U[E]$  for  $U[x \Rightarrow E]$ , when  $x$  is understood.

**Proposition 4.17.** The following rule is derivable:

$$\frac{n \in \mathbb{N} \vdash f(n) \supseteq U[n]}{f \supseteq U}$$

**Proof** Consider the following derivation:

$$\frac{\frac{\overline{z \in f} \quad (I)}{z \in f(z.x)} \quad \frac{\overline{z.x = z.x}}{z.x = z.x} \quad \frac{\overline{z.x \in \mathbb{N}}}{\vdots} \quad f(z.x) \supseteq U[z.x]}{z \in U[z.x]} \quad (I)}{z \in U} \quad (I)$$

□

And now, the key rule for program development for recursive programming: the rule for recursive synthesis:

**Proposition 4.18.** The following rule is derivable:

$$\frac{U_0 \supseteq U[0] \quad f(m) \supseteq U[m] \vdash U_1(f(m)) \supseteq U[m + 1]}{f \supseteq U}$$

**Proof** Consider the following derivation:

$$\frac{\frac{U_0 \sqsupseteq U[0] \quad \frac{\frac{z \in f(0)}{z \cdot \mathbf{x} = 0} \quad (2) \quad \frac{z \in f(0)}{z \in f} \quad (2)}{z \in U_0} \quad (2)}{z \in U[0]} \quad (2) \quad \frac{f(m+1) \sqsupseteq U[m+1]}{\delta} \quad (I)}{\frac{f(n) \sqsupseteq U[n]}{f \sqsupseteq U} \quad (O)} \quad (I)$$

where  $\delta$  is:

$$\frac{\frac{\frac{z \in f(m+1)}{z \cdot \mathbf{x} = m+1} \quad (3) \quad \frac{z \in f(m+1)}{z \in f} \quad (3)}{z \in U_1(f(m))} \quad (3) \quad \frac{f(m) \sqsupseteq U[m]}{\delta} \quad (I)}{z \in U[m+1]} \quad (3) \quad \frac{U_1(f(m)) \sqsupseteq U[m+1]}{f(m+1) \sqsupseteq U[m+1]} \quad (3)$$

□

#### 4.8. Primitive Recursion Over Lists

The technique is easy to generalise. For example:

**Definition 4.8.**

$$\text{proc } f(\mathbf{x}) \text{ cases } \mathbf{x} \text{ in Nil} : U_0; \text{ Cons } m_0 m_1 : U_1(f(m_1)) \text{ endcases} =_{df} \\ \mu X \bullet U_0 \uparrow \mathbf{x} = \text{Nil} \wedge \exists m_0, m_1 \bullet U_1(X[\mathbf{x} \Rightarrow m_1]) \uparrow \mathbf{x} = \text{Cons } m_0 m_1$$

The rule for recursive synthesis over lists:

**Proposition 4.19.** The following rule is derivable:

$$\frac{U_0 \sqsupseteq U[\text{Nil}] \quad f(m_1) \sqsupseteq U[m_1] \vdash U_1(f(m_1)) \sqsupseteq U[\text{Cons } m_0 m_1]}{f \sqsupseteq U}$$

□

#### 4.9. Primitive Recursion Over Trees

Similarly for trees:

**Definition 4.9.**

$$\text{proc } f(\mathbf{x}) \text{ cases } \mathbf{x} \text{ in Leaf } m_0 : U_0; \text{ Node } m_1 m_2 : U_1(f(m_1), f(m_2)) \text{ endcases} =_{df} \\ \mu X \bullet \exists m_0 \bullet U_0 \uparrow \mathbf{x} = \text{Leaf } m_0 \wedge \exists m_1, m_2 \bullet U_1(X[\mathbf{x} \Rightarrow m_1], X[\mathbf{x} \Rightarrow m_2]) \uparrow \mathbf{x} = \text{Node } m_1 m_2$$

The rule for recursive synthesis over trees:

**Proposition 4.20.** The following rule is derivable:

$$\frac{U_0 \sqsupseteq U[\text{Leaf } m_0] \quad f(m_1) \sqsupseteq U[m_1], f(m_2) \sqsupseteq U[m_2] \vdash U_1(f(m_1), f(m_2)) \sqsupseteq U[\text{Node } m_1 m_2]}{f \sqsupseteq U}$$

□

#### 4.10. Primitive Recursion Over Arbitrary Free-Types

All these special cases can be generalised to syntax-directed *free types*.

Types of the form  $\Upsilon$  are the names of the free types and are given by equations of the form:

$$\Upsilon ::= \dots \mid c_i \langle \dots \Upsilon_{ij} \dots \rangle \mid \dots$$

The terms of free-type:

$$t^\Upsilon ::= c_i \dots t^{\Upsilon_{ij}} \dots$$

The logic of free types permits the introduction of values in the type, equality reasoning and finally, elimination (generally by induction).

**Proposition 4.21.**

$$\frac{\dots z_{ij} \in \Upsilon_{ij} \dots}{c_i \dots z_{ij} \dots \in \Upsilon} (\Upsilon^+)$$

$$\frac{\dots z_{ij} \in \Upsilon_{ij} \dots \quad \dots z_{kl} \in \Upsilon_{kl} \dots}{c_i \dots z_{ij} \dots \neq c_k \dots z_{kl} \dots} (\Upsilon_\#)$$

$$\frac{c_i \dots z_{ij} \dots = c_i \dots y_{ij} \dots}{z_{ij} = y_{ij}} (\Upsilon_=)$$

$$\frac{\dots \dots z_{ij} \in \Upsilon_{ij} \dots, \dots P[z/y_k] \dots \vdash P[z/c_i \dots z_{ij} \dots] \quad \dots}{z \in \Upsilon \vdash P} (\Upsilon^-)$$

where the  $y_k$  are all those variables occurring in the  $z_{ij}$  with type  $\Upsilon$ .

□

Given a general free type  $\Upsilon$ , the corresponding recursive program scheme is:

**Definition 4.10.**

$$\text{proc}_\Upsilon f(x) \text{ cases } x \text{ in } \dots H_i \dots \text{ endcases}$$

where the  $H_i$  are the component cases:

$$H_i =_{df} c_i \dots m_i \dots : U_i(\dots f(w_k) \dots)$$

where the  $w_k$  are those observations among the  $m_i$  with type  $\Upsilon$ .

The semantics in the general case is given by:

**Definition 4.11.**

$$\text{proc}_\Upsilon f(x) \text{ cases } x \text{ in } \dots H_i \dots \text{ endcases} =_{df} \mu X \bullet \dots \wedge K_i(X) \wedge \dots$$

where:

$$K_i(X) =_{df} \exists \dots m_i \dots \bullet U_i(\dots X[x \Rightarrow w_k] \dots) \uparrow x = c_i \dots m_i \dots$$

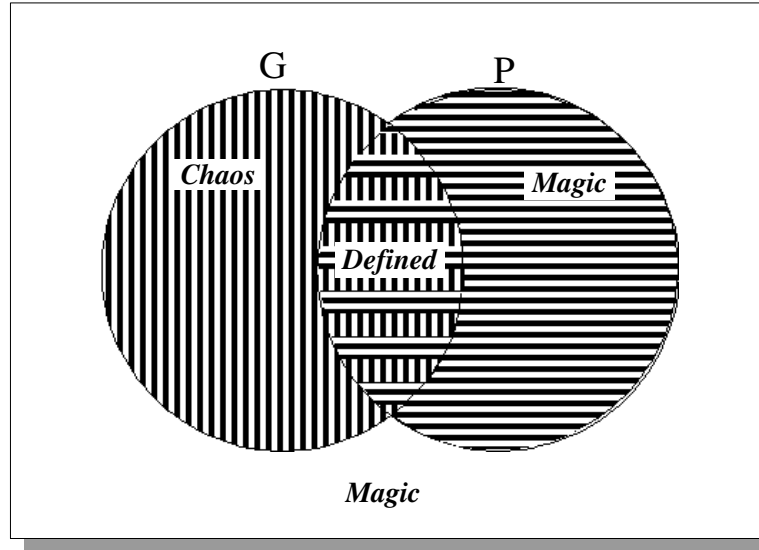

## 4.11. Guarded Commands

In this section, we extend  $\nu Z$  with the notion of *guarded commands*. Our motivation lies in the investigation of *action systems* in formalisms such as the Refinement Calculus, the B-Method [1, 29] and Z [34, 31].

The formalism of *action systems* was developed by Back *et al.* [4, 5] (as an extension of Dijkstra's language of guarded commands [22]) within the Refinement Calculus. These concepts were adapted within the B-Method by, for example, Abrial [2], Butler *et al.* [9, 8] and Waldén *et al.* [32]. Similar work (mainly related to the specification of reactive systems) in Z was done by, for example, Josephs [25], Strulo [30] and Miarka *et al.* [27]. In all these frameworks, the main concern is the issue of accommodating *both refusals and underspecification* in the same account. In other words, guards and preconditions must be able to coexist in the same specification, so as to employ both the *chaotic* and the *abortive* paradigms for refinement simultaneously.<sup>2</sup>

We shall demonstrate that the approach we have taken in  $\nu Z$  (motivated by our investigation in [21] and [14, ch.6]),

<sup>2</sup> The chaotic and the abortive paradigms for refinement are sometimes also known as the *contractual* and *behavioural* approaches (respectively) [12, ch.2-3]. We have, in previous work, examined thoroughly the concepts of both operation-refinement and data-refinement in these two paradigms. See *e.g.* [20, 17, 16, 15] for the investigation in the chaotic paradigm and *e.g.* [18, 19][14, ch.5,9] for the investigation in the abortive paradigm.

**Fig.1.** The possible regions of operation behaviour in our framework of guarded commands.

in which the refinement logic is logically prior to the schema logic, enables us to establish a logical framework for guarded commands which encompasses the strong characteristics of the above frameworks: mutual existence of both guards and preconditions in the same operation, accompanied by a powerful, and *fully-monotonic*, Z-like calculus of schema operations.

#### 4.11.1. Logic and Semantics

The approach we take in establishing the logic of guarded commands in  $\nu Z$  is more liberal than the approach employed in [27]: firstly, we use classical logic, as opposed to the non-standard *three-valued* logic employed in *ibid.*; secondly, we do not insist on the guard necessarily being weaker than the precondition. Thus, the realistic description of the possible regions of the behaviour of a guarded operation is given in Fig. 1: The region in which both the guard and the precondition hold is *defined* by the operation; outside the guard, the operation behaves *magically* (regardless of whether or not its precondition holds); and when the guard holds but the precondition doesn't, the operation behaves *chaotically*. These concepts are captured by the following definition:

**Definition 4.12.**

$$G \longrightarrow [P \mid Q] =_{df} [\neg G \mid G] \wedge [P \mid Q]$$

Notice that when the guard is false the first component schema will always be *magic*, thus the whole schema expression becomes magic; whereas when the guard is true the first component schema will always be *chaos*, thus the conjunction with the actual operation denotes a selection of specified behaviours (which, of course, depends on its precondition and postcondition).

This leads directly to the following introduction and elimination rules (we consider the more general case allowing schema sets):

**Proposition 4.22.**

$$\frac{t.G \quad t \dot{\in} U}{t \in G \longrightarrow U} (\longrightarrow^+)$$

$$\frac{t \in G \longrightarrow U}{t.G} (\longrightarrow^{\bar{0}})$$

$$\frac{t \in G \longrightarrow U}{t \dot{\in} U} (\longrightarrow^{\bar{1}})$$

□

Recasting these ideas within a single specification leads to a schema in which the guard implies the precondition and is conjoined with the postcondition. Thus, the following equation holds:

**Proposition 4.23.**

$$G \longrightarrow [P \mid Q] = [G \Rightarrow P \mid G \wedge Q]$$

**Proof**

$$\frac{\frac{\frac{\frac{}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} (I)}{z_0.G} \quad \frac{\delta}{z_0.z'_1.Q}}{z_0.z'_1.G \wedge Q}}{z_0 \star z'_1 \in [G \Rightarrow P \mid G \wedge Q]} (2)}{G \longrightarrow [P \mid Q] \sqsupseteq [G \Rightarrow P \mid G \wedge Q]} (I)$$

Where  $\delta$  stands for the following branch:

$$\frac{\frac{\frac{\frac{}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} (I)}{z_0 \star z'_1 \in [P \mid Q]} \quad \frac{\frac{}{z_0.G \Rightarrow P} (2)}{z_0.P}}{z_0.z'_1.Q}}{\frac{\frac{}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} (I)}{z_0.G}}{z_0.P}} (1)$$

For the other direction, consider the following derivation which requires the *law of excluded middle*:

$$\frac{\frac{\frac{\frac{}{z_0.G \Rightarrow P \vee z_0.G \wedge \neg P} (LEM)}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} \quad \frac{\frac{\delta_0}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} \quad \frac{\delta_1}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]}}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} (2)}{\frac{\frac{}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]} (I)}{[G \Rightarrow P \mid G \wedge Q] \sqsupseteq G \longrightarrow [P \mid Q]}} (1)$$

Where  $\delta_0$  is:

$$\frac{\frac{\frac{\frac{}{z_0 \star z'_1 \in [G \Rightarrow P \mid G \wedge Q]} (I)}{z_0.z'_1.G \wedge Q} \quad \frac{\frac{}{z_0.G \Rightarrow P} (2)}{z_0.P}}{z_0.G}}{\frac{\frac{\frac{}{z_0 \star z'_1 \in [G \Rightarrow P \mid G \wedge Q]} (I)}{z_0.z'_1.G \wedge Q} \quad \frac{\frac{}{z_0.G \Rightarrow P} (2)}{z_0.P}}{z_0 \star z'_1 \in [P \mid Q]}}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]}} (1)$$

and  $\delta_1$  is:

$$\frac{\frac{\frac{\frac{}{z_0.G \wedge \neg P} (2)}{z_0.G} \quad \frac{\frac{\frac{}{z_0.G \wedge \neg P} (2)}{z_0.P} \quad \frac{\frac{}{\neg z_0.P} (3)}{\neg z_0.P}}{z_0.P}}{\frac{\frac{}{z_0.G \wedge \neg P} (2)}{z_0.G} \quad \frac{\frac{}{z_0 \star z'_1 \in [P \mid Q]} (3)}{z_0 \star z'_1 \in [P \mid Q]}}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q]}} (2)$$

□

#### 4.11.2. Refinement Logic

In the approach developed in [27], an operation behaves chaotically (*i.e.* divergence including  $\perp$ ) when its guard holds and its precondition doesn't hold, but it behaves *abortively* (*i.e.* strictly  $\perp$ ) outside its guard. This gives rise to a notion of refinement in which not only preconditions may weaken and postconditions may strengthen, but also the guard may be strengthened. This, of course, is very intuitive because strengthening the guard merely means substituting undefined behaviour with abortive behaviour. However, in such an approach, the refinement rules must guarantee that “the precondition is the *upper bound* for strengthening the guard and the guard is the *lower bound* for weakening the precondition” [27]. This is in order to prevent abortive behaviour from substituting defined behaviour, on one hand, and chaotic behaviour from substituting abortive behaviour, on the other hand.

Conversely, in our framework the behaviour outside the guard is *magical* (as shown in Fig. 1). In which case, not only is it possible to strengthen the guard beyond the precondition in a refinement step (because the specification *magic* lies at the bottom of the refinement hierarchy in every framework which employs explicit preconditions and postconditions), but also it is possible to weaken the precondition beyond the guard (because, either way, any new behaviour that is outside the guard will be magical). Hence, we get the following basic refinement inequations for guarded commands.

**Proposition 4.24.** Weakening preconditions:

$$\frac{z.P_1 \vdash z.P_0}{G \longrightarrow [P_0 \mid Q] \sqsupseteq G \longrightarrow [P_1 \mid Q]}$$

**Proof**

$$\frac{\frac{\frac{z_0 \star z'_1 \in G \longrightarrow [P_0 \mid Q]}{z_0.G} \quad (I) \quad \frac{\frac{\frac{z_0 \star z'_1 \in G \longrightarrow [P_0 \mid Q]}{z_0 \star z'_1 \in [P_0 \mid Q]} \quad (I) \quad \frac{z_0.P_1}{\vdots} \quad (2)}{z_0 \star z'_1 \in [P_0 \mid Q]} \quad (2)}{z_0 \star z'_1 \in [P_1 \mid Q]} \quad (2)}{z_0 \star z'_1 \in G \longrightarrow [P_1 \mid Q]} \quad (I) \quad \frac{z_0 \star z'_1 \in G \longrightarrow [P_0 \mid Q] \sqsupseteq G \longrightarrow [P_1 \mid Q]}{G \longrightarrow [P_0 \mid Q] \sqsupseteq G \longrightarrow [P_1 \mid Q]} \quad (I)}$$

□

**Proposition 4.25.** Strengthening postconditions:

$$\frac{z.Q_0 \vdash z.Q_1}{G \longrightarrow [P \mid Q_0] \sqsupseteq G \longrightarrow [P \mid Q_1]}$$

**Proof**

$$\frac{\frac{\frac{z_0 \star z'_1 \in G \longrightarrow [P \mid Q_0]}{z_0.G} \quad (I) \quad \frac{\frac{\frac{z_0 \star z'_1 \in G \longrightarrow [P \mid Q_0]}{z_0 \star z'_1 \in [P \mid Q_0]} \quad (I) \quad \frac{z_0.P}{\vdots} \quad (2)}{z_0 \star z'_1 \in [P \mid Q_0]} \quad (2)}{z_0 \star z'_1 \in [P \mid Q_1]} \quad (2)}{z_0 \star z'_1 \in G \longrightarrow [P \mid Q_1]} \quad (I) \quad \frac{z_0 \star z'_1 \in G \longrightarrow [P \mid Q_0] \sqsupseteq G \longrightarrow [P \mid Q_1]}{G \longrightarrow [P \mid Q_0] \sqsupseteq G \longrightarrow [P \mid Q_1]} \quad (I)}$$

□

**Proposition 4.26.** Strengthening the guard:

$$\frac{z.G_0 \vdash z.G_1}{G_0 \longrightarrow [P \mid Q] \sqsupseteq G_1 \longrightarrow [P \mid Q]}$$

**Proof**

$$\frac{\frac{\frac{z_0 \star z'_1 \in G_0 \longrightarrow [P \mid Q]}{z_0.G_0} \quad (I) \quad \frac{\frac{\frac{z_0 \star z'_1 \in G_0 \longrightarrow [P \mid Q]}{z_0 \star z'_1 \in [P \mid Q]} \quad (I) \quad \frac{z_0.G_1}{\vdots} \quad (2)}{z_0 \star z'_1 \in [P \mid Q]} \quad (2)}{z_0 \star z'_1 \in G_1 \longrightarrow [P \mid Q]} \quad (I) \quad \frac{z_0 \star z'_1 \in G_0 \longrightarrow [P \mid Q] \sqsupseteq G_1 \longrightarrow [P \mid Q]}{G_0 \longrightarrow [P \mid Q] \sqsupseteq G_1 \longrightarrow [P \mid Q]} \quad (I)}$$

□

Given the nice properties of guarded commands in our framework (see Fig. 1), it is interesting to note that *any* operation is equivalent to a disjunction of its guarded commands, formed with converse guards; this result is true for *any* guard:

**Proposition 4.27.**

$$\forall G \bullet U = G \longrightarrow U \vee \neg G \longrightarrow U$$

**Proof** We prove this using refinement:

$$\frac{\frac{z \in G \longrightarrow U \vee \neg G \longrightarrow U \quad (I) \quad \frac{z \in G \longrightarrow U \quad (2) \quad \frac{z \in \neg G \longrightarrow U \quad (2)}{z \in U}}{z \in U} \quad (2)}{z \in U} \quad (2)}{G \longrightarrow U \vee \neg G \longrightarrow U \sqsupseteq U} \quad (I)$$

For the other direction, consider the following derivation which requires the *law of excluded middle*:

$$\frac{\frac{z.G \vee \neg z.G \quad (LEM) \quad \frac{\frac{z.G \quad (2) \quad \frac{z \in U \quad (I)}{z \in G \longrightarrow U} \quad (1) \quad \frac{\frac{\neg z.G \quad (2) \quad \frac{z \in U \quad (I)}{z \in \neg G \longrightarrow U} \quad (1)}{z \in G \longrightarrow U \vee \neg G \longrightarrow U} \quad (2)}{z \in G \longrightarrow U \vee \neg G \longrightarrow U} \quad (2)}{z \in G \longrightarrow U \vee \neg G \longrightarrow U} \quad (1)}{U \sqsupseteq G \longrightarrow U \vee \neg G \longrightarrow U} \quad (I)}{U \sqsupseteq G \longrightarrow U \vee \neg G \longrightarrow U} \quad (I)$$

□

#### 4.11.3. Guarded Conditional

We define a *guarded conditional* operator, in terms of disjunction of two schemas guarded by converse guards:

**Definition 4.13.**

$$\text{gif } D \text{ then } U_0^{\mathbb{P} T_0} \text{ else } U_1^{\mathbb{P} T_1} =_{df} D \longrightarrow U_0 \vee \neg D \longrightarrow U_1$$

The following introduction and elimination rules are immediately derivable for the guarded conditional:

**Proposition 4.28.**

$$\frac{t.D \quad t \in U_0}{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1} \quad (\text{gif}_0^+) \quad \frac{\neg t.D \quad t \in U_1}{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1} \quad (\text{gif}_1^+)$$

$$\frac{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1 \quad t \in D \longrightarrow U_0 \vdash P \quad t \in \neg D \longrightarrow U_1 \vdash P}{P} \quad (\text{gif}^-)$$

□

Using our usual strategy involving elimination rules, we now demonstrate that the above theory is *equivalent* to the conditional theory we established in section 4.3. We begin by showing that every guarded conditional is a valid conditional in the “if” theory.

**Proposition 4.29.** The following rules are derivable:

$$\frac{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1 \quad t.D}{t \in U_0} \quad (i) \quad \frac{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1 \quad \neg t.D}{t \in U_1} \quad (ii)$$

**Proof** For (i), consider the following derivation:

$$\frac{\frac{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1 \quad t \in U_0 \quad (I) \quad \frac{\frac{t \in D \longrightarrow U_0 \quad (I) \quad \frac{\frac{t \in \neg D \longrightarrow U_1 \quad (I) \quad \frac{\neg t.D}{false}}{t \in U_0}}{t \in U_0} \quad (I)}{t \in U_0} \quad (I)}{t \in U_0} \quad (I)}{t \in U_0} \quad (I)}{t \in U_0} \quad (I)$$

For (ii), consider the following derivation:

$$\frac{\frac{\frac{\overline{t \in D \rightarrow U_0}}{t.D} (I) \quad \neg t.D}{\text{false}}}{t \in U_1} \quad \frac{\overline{t \in \neg D \rightarrow U_1}}{t \in U_1} (I)}{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1 \quad t \in U_1} (I)$$

□

Then by propositions 4.29(i) and (ii), and the rule (if<sup>+</sup>), the following theorem is immediate:

**Theorem 4.30.**

$$\frac{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1}{t \in \text{if } D \text{ then } U_0 \text{ else } U_1}$$

□

Turning now to showing that every conditional in the “if” theory is a valid guarded conditional.

**Proposition 4.31.**

$$\frac{t \in \text{if } D \text{ then } U_0 \text{ else } U_1 \quad t \in D \rightarrow U_0 \vdash P \quad t \in \neg D \rightarrow U_1 \vdash P}{P}$$

**Proof** Consider the following derivation, which requires the *law of excluded middle*:

$$\frac{\frac{\overline{t.D} (I) \quad \frac{t \in \text{if } D \text{ then } U_0 \text{ else } U_1 \quad \overline{t.D} (I)}{t \in U_0}}{t \in D \rightarrow U_0} \quad \delta}{\frac{\overline{t.D \vee \neg t.D} (LEM) \quad \frac{\vdots}{P}}{P}} (I)$$

Where  $\delta$  stands for the following branch:

$$\frac{\frac{\overline{\neg t.D} (I) \quad \frac{t \in \text{if } D \text{ then } U_0 \text{ else } U_1 \quad \overline{\neg t.D} (I)}{t \in U_1}}{t \in \neg D \rightarrow U_1} \quad \vdots}{P}$$

□

Then by proposition 4.31, in addition to the rules (gif<sub>0</sub><sup>+</sup>) and (gif<sub>1</sub><sup>+</sup>), the following theorem is immediately derivable:

**Theorem 4.32.**

$$\frac{t \in \text{if } D \text{ then } U_0 \text{ else } U_1}{t \in \text{gif } D \text{ then } U_0 \text{ else } U_1}$$

□

Together, theorems 4.30 and 4.32 demonstrate that the concepts of *conditional* and *guarded conditional* control structures are equivalent.

#### 4.11.4. Guarded Case Statement

We generalise the guarded conditional to guarded case statement. This is defined as *parallel composition* of commands whose guards are drawn from a given set of values:

**Definition 4.14.** Let  $T = \{\dots c_i \dots\}$ .

$$\text{gcases } E^T \text{ in } c_0 : U_0^{\mathbb{P} T_0} \dots c_n : U_n^{\mathbb{P} T_n} \text{ endgcases} =_{df} \bigvee_{i=0}^n E = c_i \longrightarrow U_i$$

The following introduction and elimination rules are derivable for guarded cases:

**Proposition 4.33.** Let  $i \in n + 1$ .

$$\frac{t.(E = c_i) \quad t \dot{\in} U_i}{t \in \text{gcases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endgcases}} \text{ (gcases}_i^+) \quad \frac{t \in \text{gcases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endgcases} \quad \dots \quad t \in E = c_i \longrightarrow U_i \vdash P \quad \dots}{P} \text{ (gcases}^-)$$

□

In light of theorems 4.30 and 4.32, in conjunction with the fact that the “cases” (section 4.4) and “gcases” theories respectively generalise the theories of “if” (section 4.3) and “gif” (section 4.11.3), it is evident that the former theories are also equivalent; the rest of the section is devoted to proving this result. We begin by showing that every guarded case statement is also a valid case statement in the “cases” theory.

**Proposition 4.34.** Let  $i \in n + 1$ , then the following rule is derivable:

$$\frac{t \in \text{gcases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endgcases} \quad t.(E = c_i)}{t \dot{\in} U_i}$$

**Proof** Let  $k \in n + 1$ , where  $k \neq i$ .

$$\frac{t \in \text{gcases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endgcases} \quad \frac{t \in E = c_i \longrightarrow U_i}{t \dot{\in} U_i} \text{ (I)} \quad \begin{array}{c} \delta \\ \vdots \\ t \dot{\in} U_i \end{array} \quad \dots}{t \dot{\in} U_i} \text{ (I)}$$

Where  $\delta$  stands for the following branch:

$$\frac{\frac{t \in E = c_k \longrightarrow U_k}{t.(E = c_k)} \text{ (I)} \quad t.(E = c_i)}{\frac{c_k = c_i}{false}} \quad \frac{false}{t \dot{\in} U_i}$$

□

This (in conjunction with the rule (cases<sup>+</sup>)) leads directly to the following theorem:

**Theorem 4.35.**

$$\frac{t \in \text{gcases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endgcases}}{t \in \text{cases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endcases}}$$

□

Turning now to showing that every case statement is also a valid guarded case statement.

**Proposition 4.36.** Let  $i \in n + 1$ , then the following rule is derivable:

$$\frac{t \in \text{cases } E \text{ in } c_0 : U_0 \dots c_n : U_n \text{ endcases} \quad \dots \quad t \in E = c_i \longrightarrow U_i \vdash P \quad \dots}{P}$$

**Proof**

$$\frac{\frac{t \in \text{cases } E \text{ in } c_0 : U_0 \cdots c_n : U_n \text{ endcases}}{\bigvee_{i=0}^n t.(E = c_i)} \quad \begin{array}{c} \delta \\ \vdots \\ \dot{P} \end{array} \quad \dots \quad \dot{P} \quad \dots}{P} \quad (I)$$

Where  $\delta$  stands for the following branch:

$$\frac{\frac{t.(E = c_i)}{t.(E = c_i)} \quad (I) \quad \frac{t \in \text{cases } E \text{ in } c_0 : U_0 \cdots c_n : U_n \text{ endcases} \quad \overline{t.(E = c_i)}}{t \in U_i} \quad (I)}{t \in E = c_i \longrightarrow U_i} \quad \begin{array}{c} \vdots \\ \dot{P} \end{array}$$

□

Then by proposition 4.36, in addition to the rules ( $\text{gcases}_i^+$ ), we get the following theorem immediately:

**Theorem 4.37.**

$$\frac{t \in \text{cases } E \text{ in } c_0 : U_0 \cdots c_n : U_n \text{ endcases}}{t \in \text{gcases } E \text{ in } c_0 : U_0 \cdots c_n : U_n \text{ endgcases}}$$

□

Theorems 4.35 and 4.37 together establish that the theories of *cases* and *guarded cases* are equivalent. This concludes the analysis.

## 4.12. While Loop

### 4.12.1. Logic and Semantics

**Definition 4.15.**

$$\text{while } D \text{ do } U =_{df} \mu X \bullet D \longrightarrow U \circlearrowleft X \vee \neg D \longrightarrow \text{skip}$$

The following introduction and elimination rules are sound for the while loop:

**Proposition 4.38.**

$$\frac{\neg z.D \quad z \dot{\in} \text{skip}}{z \in \text{while } D \text{ do } U} \quad (\text{while}_0^+)$$

**Proof** Let  $W$  be  $\mu X \bullet D \longrightarrow U \circlearrowleft X \vee \neg D \longrightarrow \text{skip}$ .

$$\frac{\frac{\frac{\neg z.D \quad z \dot{\in} \text{skip}}{z \dot{\in} \neg D \longrightarrow \text{skip}}}{z \in D \longrightarrow U \circlearrowleft W \vee \neg D \longrightarrow \text{skip}}}{z \in \text{while } D \text{ do } U} \quad (\mu^+)$$

□

**Proposition 4.39.**

$$\frac{z.D \quad z_0 \star y' \dot{\in} U \quad z_0 =_{T_L} y \quad y \star z'_1 \dot{\in} \text{while } D \text{ do } U \quad y =_{T_R} z_1}{z_0 \star z'_1 \dot{\in} \text{while } D \text{ do } U} \quad (\text{while}_1^+)$$

**Proof** Let  $W$  be  $\mu X \bullet D \longrightarrow U \circlearrowleft X \vee \neg D \longrightarrow \text{skip}$ .

$$\frac{\frac{\frac{z_0 \star y' \in U \quad z_0 =_{T_L} y \quad y \star z'_1 \in \text{while } D \text{ do } U \quad y =_{T_R} z_1}{z_0 \star z'_1 \in U \ ; \ W}}{z_0, z'_1 . D}}{z_0 \star z'_1 \in D \longrightarrow U \ ; \ W}}{\frac{z_0 \star z'_1 \in D \longrightarrow U \ ; \ W \vee \neg D \longrightarrow \text{skip}}{z_0 \star z'_1 \in \text{while } D \text{ do } U}} \ (\mu^+)$$

□

**Proposition 4.40.**

$$\frac{\frac{z \in \text{while } D \text{ do } U \quad \neg z . D, z \in \text{skip} \quad \vdash P \quad z . D, z_0 \star y' \in U, z_0 =_{T_L} y, y \star z'_1 \in \text{while } D \text{ do } U, y =_{T_R} z_1 \quad \vdash P}{P}} \ (\text{while}^-)$$

**Proof** Let  $W$  be  $\mu X \bullet D \longrightarrow U \ ; \ X \vee \neg D \longrightarrow \text{skip}$ .

$$\frac{\frac{z \in \text{while } D \text{ do } U}{z \in D \longrightarrow U \ ; \ W \vee \neg D \longrightarrow \text{skip}} \ (\mu^-) \quad \begin{array}{c} \delta_0 \quad \delta_2 \\ \vdots \quad \vdots \\ P \quad P \end{array}}{P} \ (1)$$

where  $\delta_0$  is:

$$\frac{\frac{z \in D \longrightarrow U \ ; \ W} \ (1a) \quad \begin{array}{c} \delta_1 \\ \vdots \\ P \end{array}}{z \in U \ ; \ W} \ (2) \quad P$$

where  $\delta_1$  is:

$$\frac{\frac{\frac{z \in D \longrightarrow U \ ; \ W} \ (1a)}{z . D} \quad \frac{\quad}{z_0 \star y' \in U} \ (2) \quad \frac{\quad}{z_0 =_{T_L} y} \ (2) \quad \frac{\quad}{y \star z'_1 \in W} \ (2) \quad \frac{\quad}{y =_{T_R} z_1} \ (2)}{\vdots} \ P$$

where  $\delta_2$  is:

$$\frac{\frac{\frac{z \in \neg D \longrightarrow \text{skip}} \ (1b)}{\neg z . D} \quad \frac{\frac{z \in \neg D \longrightarrow \text{skip}} \ (1b)}{z \in \text{skip}}}{\vdots} \ P$$

□

The following additional rules are derivable:

**Lemma 4.41.**

$$\frac{z \in \text{while } D \text{ do } U \quad \neg z . D}{z \in \text{skip}}$$

**Proof**

$$\frac{z \in \text{while } D \text{ do } U \quad \frac{\quad}{z \in \text{skip}} \ (0) \quad \frac{\frac{\neg z . D \quad \overline{z . D}}{\text{false}} \ (0)}{z \in \text{skip}} \ (0)}{z \in \text{skip}}$$

□

**Lemma 4.42.**

$$\frac{z \in \text{while } D \text{ do } U \quad z.D}{z \in U \ ; \ \text{while } D \text{ do } U}$$

**Proof**

$$\frac{\frac{z.D \quad \overline{\neg z.D} \quad (0)}{\text{false}} \quad \delta_0 \quad \dots}{z \in \text{while } D \text{ do } U \quad \frac{z \in U \ ; \ \text{while } D \text{ do } U}{z \in U \ ; \ \text{while } D \text{ do } U} \quad z \in U \ ; \ \text{while } D \text{ do } U} \quad (0)$$

where  $\delta_0$  is:

$$\frac{\frac{z_0 \star y' \in U \quad (0)}{z_0 =_{T_L} y} \quad (0) \quad \frac{y \star z'_1 \in \text{while } D \text{ do } U \quad (0)}{y =_{T_R} z_1} \quad (0)}{z \in U \ ; \ \text{while } D \text{ do } U}$$

□

#### 4.12.2. Inequational Refinement Logic

**Proposition 4.43.**

$$\frac{\frac{\neg z.D \quad \vdash \text{skip} \sqsupseteq U_1[0]}{z.D, \text{while } D \text{ do } U_0[f(n)] \sqsupseteq U_1[f(n)]} \quad \vdash \quad U_0 \ ; \ \text{while } D \text{ do } U_0[f(n)] \sqsupseteq U_1[n]}{\text{while } D \text{ do } U_0 \sqsupseteq U_1}$$

**Proof**

$$\frac{\frac{\delta_0 \quad \dots}{z \in U_1[0]} \quad (2) \quad \frac{\delta_2 \quad \dots}{z \in U_1[n]} \quad (3)}{\frac{\text{while } D \text{ do } U_0[0] \sqsupseteq U_1[0] \quad \text{while } D \text{ do } U_0[n] \sqsupseteq U_1[n]}{\text{while } D \text{ do } U_0[n] \sqsupseteq U_1[n]} \quad (1)}{\text{while } D \text{ do } U_0 \sqsupseteq U_1} \quad (0)$$

where  $\delta_0$  is:

$$\frac{\frac{\frac{z \in \text{while } D \text{ do } U_0[0] \quad (2)}{z \in \text{while } D \text{ do } U_0} \quad \frac{\delta_1 \quad \dots}{z.y = 0} \quad \frac{\delta_1 \quad \dots}{z.y = 0}}{z \in \text{skip}} \quad 4.41 \quad \frac{\frac{\delta_1 \quad \dots}{z.y = 0} \quad \frac{\delta_1 \quad \dots}{\text{skip} \sqsupseteq U_1}}{z \in U_1} \quad \frac{\delta_1 \quad \dots}{z.y = 0}}{z \in U_1[0]}$$

where  $\delta_1$  is:

$$\frac{\overline{z \in \text{while } D \text{ do } U_0[0]} \quad (2)}{z.y = 0}$$

where  $\delta_2$  is:

$$\frac{\delta_4 \quad \dots \quad \delta_3 \quad \dots}{z \in U_0 \ ; \ \text{while } D \text{ do } U_0[f(n)] \quad U_0 \ ; \ \text{while } D \text{ do } U_0[f(n)] \sqsupseteq U_1[n]}{\frac{\overline{z \in U_0 \ ; \ \text{while } D \text{ do } U_0[f(n)]} \quad U_0 \ ; \ \text{while } D \text{ do } U_0[f(n)] \sqsupseteq U_1[n]}{z \in U_1[n]}}$$

where  $\delta_3$  is:

$$\frac{\frac{\frac{z \in \text{while } D \text{ do } U_0[n]}{z.y = n} \quad (3)}{z.D} \quad \frac{n > 0}{n > 0} \quad (I)}{\text{while } D \text{ do } U_0[f(n)] \sqsupseteq U_1[f(n)]} \quad (I)$$

$$U_0 \text{ ; while } D \text{ do } U_0[f(n)] \sqsupseteq U_1[n]$$

where  $\delta_4$  is:

$$\frac{\frac{\frac{z \in \text{while } D \text{ do } U_0[n]}{z \in \text{while } D \text{ do } U_0} \quad (3)}{z \in U_0 \text{ ; while } D \text{ do } U_0[f(n)]} \quad \frac{\delta_5, \delta_6}{z \in U_0 \text{ ; while } D \text{ do } U_0[f(n)]} \quad (4)}{z \in U_0 \text{ ; while } D \text{ do } U_0[f(n)]} \quad (4)$$

where  $\delta_5$  is:

$$\frac{\frac{\frac{\frac{z \in \text{while } D \text{ do } U_0[n]}{z.y = n} \quad (3)}{\neg z.D} \quad (4)}{z.D} \quad \frac{n > 0}{n > 0} \quad (I)}{false} \quad (4)}{z \in U_0 \text{ ; while } D \text{ do } U_0[f(n)]}$$

where  $\delta_6$  is:

$$\frac{\frac{\frac{z_0 \star w' \in U_0}{z_0 \star w' \in U_0} \quad (4) \quad \frac{z_0 =_{T_L} w}{z_0 =_{T_L} w} \quad (4) \quad \frac{\delta_7}{w \star z'_1 \in \text{while } D \text{ do } U_0[f(n)]} \quad (4) \quad \frac{w =_{T_R} z_1}{w =_{T_R} z_1} \quad (4)}{z \in U_0 \text{ ; while } D \text{ do } U_0[f(n)]}}$$

where  $\delta_7$  is:

$$\frac{\frac{\frac{w \star z'_1 \in \text{while } D \text{ do } U_0}{w \star z'_1 \in \text{while } D \text{ do } U_0} \quad (4) \quad \frac{\frac{z_0 \star w' \in U_0}{f(z_0.y) = w.y} \quad (4) \quad \frac{\delta_8}{z_0.y = n}}{w.y = f(n)} \quad (\clubsuit)}{w \star z'_1 \in \text{while } D \text{ do } U_0[f(n)]}}$$

where  $\delta_8$  is:

$$\frac{\frac{z \in \text{while } D \text{ do } U_0[n]}{z_0.y = n} \quad (3)}{z_0.y = n}$$

□

Rule used to perform step (1)

$$\frac{P(0) \quad n > 0, m < n, P(m) \vdash P(n)}{P(n)} \quad (I)$$

$$\frac{z_0 \star z'_1 \in U}{f(z_0.y) = z_1.y} \quad (\clubsuit)$$

#### 4.12.3. General Refinement Logic

We generalise on the previous section in two aspects: first, the variant now depends on a particular state, rather than on a single observation; secondly, the state observations are not necessarily numeric. This concept is easily attained by defining a function  $f$  which associates every state of the system with a particular numeric value. Namely:

$$f \in T \rightarrow \mathbb{N}$$

Then the following rule is derivable:

**Proposition 4.44.**

$$\frac{\text{skip} \sqsupseteq U_1 \uparrow \neg D \quad \frac{\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = m) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = m) \vdash U_0 \text{ ; (while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = m) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = n)}}{\text{while } D \text{ do } U_0 \sqsupseteq U_1}}$$

**Proof** Consider the following derivation which employs *course of values* induction:

$$\frac{\frac{\delta_0 \quad \dots \quad \text{(while } D \text{ do } U_0) \uparrow \neg D \sqsupseteq U_1 \uparrow \neg D}{\text{while } D \text{ do } U_0 \sqsupseteq U_1} \quad \frac{\delta_1 \quad \dots \quad \text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = x) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = x)}}{\text{(while } D \text{ do } U_0) \uparrow D \sqsupseteq U_1 \uparrow D}}{\text{while } D \text{ do } U_0 \sqsupseteq U_1}}$$

Where  $\delta_0$  stands for the following branch:

$$\frac{\frac{\frac{\frac{\text{(while } D \text{ do } U_0) \uparrow \neg D \sqsupseteq U_1 \uparrow \neg D \quad (1) \quad \frac{\neg z.D \quad (2)}{\text{while } D \text{ do } U_0}}{z \in \text{while } D \text{ do } U_0}}{z \in U_1} \quad \frac{\eta \quad \frac{\frac{z.D \quad (3) \quad \frac{\neg z.D \quad (2)}{\text{false}}}{z \in U_1}}{z \in U_1}}{z \in U_1}}{z \in U_1} \quad (3)}{\frac{z \in U_1}{z \in U_1 \uparrow \neg D} \quad (2)}{\text{(while } D \text{ do } U_0) \uparrow \neg D \sqsupseteq U_1 \uparrow \neg D} \quad (1)}$$

Where  $\eta$  is:

$$\frac{\frac{\frac{z \in \text{skip} \quad (3) \quad \text{skip} \sqsupseteq U_1 \uparrow \neg D}{z \in U_1 \uparrow \neg D} \quad \frac{\neg z.D \quad (3)}{\neg z.D} \quad (3)}{z \in U_1}}$$

Let  $\varphi_0$  and  $\varphi_n$  respectively be:

$$\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = 0) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = 0)$$

and

$$\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = n) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = n)$$

then  $\delta_1$  stands for the following branch:

$$\frac{\frac{\beta_0 \quad \dots \quad \varphi_0}{\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = x) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = x)} \quad \frac{\beta_1 \quad \dots \quad \varphi_n}{\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = x) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = x)}}{\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = x) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = x)} \quad (4)$$

Where  $\beta_0$  is:

$$\frac{\frac{\frac{\frac{z \in \text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = 0) \quad (5) \quad \frac{z.(D \wedge f(\theta T) = 0) \quad (6)}{z.(D \wedge f(\theta T) = 0)}}{z \in \text{while } D \text{ do } U_0}}{z \in U_1} \quad \frac{\alpha_0 \quad \dots \quad \alpha_1}{z \in U_1 \quad z \in U_1} \quad (7)}{\frac{z \in U_1}{z \in U_1 \uparrow (D \wedge f(\theta T) = 0)} \quad (6)}{\text{(while } D \text{ do } U_0) \uparrow (D \wedge f(\theta T) = 0) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = 0)} \quad (5)}$$

and  $\alpha_0, \alpha_1$  are respectively:

$$\frac{\frac{\frac{z \in \text{skip} \quad (7) \quad \text{skip} \sqsupseteq U_1 \uparrow \neg D}{z \in U_1 \uparrow \neg D} \quad \frac{\neg z.D \quad (7)}{\neg z.D} \quad (7)}{z \in U_1} \quad \frac{\frac{\frac{z.(D \wedge f(\theta T) = 0) \quad (6)}{z.(f(\theta T) = 0)} \quad \frac{f(z) = 0}{\neg z.D} \quad (\clubsuit)}{z.D} \quad (7)}{\text{false}} \quad (7)}{z \in U_1}}$$

$\beta_1$  stands for the following branch:

$$\frac{\frac{\frac{z \in (\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = n)}{z \in \mathbf{while} \ D \ \mathbf{do} \ U_0} \ (8) \quad \frac{z.(D \wedge f(\theta T) = n)}{z \in U_1} \ (9) \quad \begin{array}{c} \gamma_0 \\ \vdots \\ \gamma_1 \\ \vdots \\ z \in U_1 \end{array}}{z \in U_1} \ (10)}{\frac{\frac{z \in U_1}{z \in U_1 \uparrow (D \wedge f(\theta T) = n)} \ (9)}{(\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = n) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = n)} \ (8)}$$

Where  $\gamma_0$  is:

$$\frac{\frac{z.(D \wedge f(\theta T) = n)}{z.D} \ (9) \quad \frac{}{\neg z.D} \ (10)}{\frac{false}{z \in U_1}}$$

Let  $\psi$  be:

$$z \in U_0 \circ (\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = m)$$

then  $\gamma_1$  branch is:

$$\frac{\frac{\frac{(\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = m) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = m)}{U_0 \circ (\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = m) \sqsupseteq U_1 \uparrow (D \wedge f(\theta T) = n)} \ (4) \quad \begin{array}{c} \gamma_2 \\ \vdots \\ \psi \\ \vdots \\ z \in U_1 \end{array}}{\frac{z \in U_1 \uparrow (D \wedge f(\theta T) = n)}{z \in U_1} \ (9)} \ (9)$$

Where  $\gamma_2$  stands for the following branch:

$$\frac{\frac{\frac{z_0 \star y' \in U_0}{} \ (10) \quad \frac{z_0 =_{T_L} y}{} \ (10) \quad \frac{\frac{y \star z'_1 \in \mathbf{while} \ D \ \mathbf{do} \ U}{y \star z'_1 \in (\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = m)}{} \ (10) \quad \frac{y =_{T_R} z_1}{} \ (10)}{z \in U_0 \circ (\mathbf{while} \ D \ \mathbf{do} \ U_0) \uparrow (D \wedge f(\theta T) = m)} \ (10)}$$

□

## 5. Conclusions and Further Work

As we mentioned in the introduction, this expository paper concentrates entirely on the theoretical basis of  $\nu Z$ . We have showed how an extremely simple logic can be extended towards an expressive specification logic and a program (development) logic. One of the benefits of this approach is its flexibility: one is not constrained by any particular specification or programming language infrastructure. The ability to provide elegant rules for total correctness development of procedures is also a strength: these rules resemble those which proved so useful in program development within constructive theories (see, for example, [26]) but are here combined with the ability to synthesize imperative programs.

Much infrastructural and pragmatic work remains to be done, both at the level of specification and program development. At the pragmatic level in particular, much work is being undertaken by Kajtazi and this will be reported in his PhD thesis.

## 6. Acknowledgements

The authors are grateful to Steve Reeves and Lindsay Groves for numerous discussions and critical appraisal of this work. We would like to acknowledge the support of the EPSRC RefineNet Network Grant (Ref: GR/S69979/02) in the development of this work, including comments from participants at the January 2004 meeting in Sheffield where an earlier version of this material was presented.
