## Abstract

This interdisciplinary scoping review addresses the involvement of spoken and signed language interpreters in statutory mental health assessments. Specifically, it sought to identify and review pre-existing literature concerning the barriers and facilitators to effective practice in interpreter-mediated statutory mental health assessments, and the extent to which interpreter mediation supports or impedes a person's legal rights and best interests in this context. An interdisciplinary team applied the revised Joanna Briggs Institute scoping review framework to review forty-four items of empirical and grey literature covering relevant aspects of the available body of knowledge across the fields of social work, mental health and interpreting studies.

The review concludes that there is a lack of direct evidence on interpreting practice in the context of statutory mental health assessments, which is significant considering the high-stakes scenarios that may lead to the deprivation of liberty. The findings suggest that there is insufficient evidence about how the involvement of interpreters in statutory mental health assessments requires adjustments to standard interpreting and monolingual assessment practice. This work highlights the need for more focussed research on good practices for interpreting in this context and calls for guidance for effective interprofessional working between interpreters and other professionals involved.

## 1. Introduction

This article concerns statutory mental health assessments potentially leading to involuntary detention in a psychiatric facility whether for further assessment and/or mental health treatment. In England and Wales, the statutory instrument governing this is the Mental Health Act 1983 (henceforth MHA), and similar legislation is present worldwide (Fistein et al., 2009). Specifically, the focus of this work is on understanding the practice of assessments in circumstances where an interpreter is required. We present the results of an international and interdisciplinary scoping review that sought to identify and examine pre-existing literature concerning the barriers and facilitators to effective practice in interpreter-mediated statutory mental health assessments or Mental Health Act Assessments (henceforth MHAAs). We also explore the extent to which interpreter-mediation supports or impedes the legal rights and best interests of those being assessed within this context. It is important to note that statutory assessments related to mental capacity rather than mental illness fall outside the scope of this work.

## 2. Background

### *2.1 Topic and significance*

MHAAs potentially leading to involuntary detention and treatment differ from those that might occur within a clinical diagnostic process or during ongoing treatment and therapy. In the latter scenarios, there is a growing body of existing literature in the field of interpreting and translation (e.g., Boyles and Talbot, 2017; Costa, 2022; Luk, 2008). MHAAs however usually occur in emergency or urgent circumstances where all parties are unlikely to have a pre-existing working relationship. In addition, the assessment process is explicitly bound by legislation, and is the most powerful civil practice whose powers can override, for instance, an individual's rights under Human Rights legislation. MHAAs require the co-operation of

1  
2  
3 several doctors and non-medical professionals at a time when an individual is experiencing a  
4 serious mental health episode that may even potentially pose a risk to themselves or others.

5  
6  
7 These are high stakes circumstances in which an individual's communication, language,  
8  
9  
10 behaviour and understanding are likely to be altered and/or impaired because of their mental  
11  
12 state. Consequently, the way an interpreter practices, how other professionals work alongside  
13  
14 them, and the effects of interpreter mediation on the outcomes for the person being assessed  
15  
16 become a significant concern. This concern is the subject of the INForMHAA (Interpreters  
17  
18 for Mental Health Act Assessments) (see Young et al., 2023), a project investigating  
19  
20 professional practice and outcomes in interpreter-mediated assessments in the context of the  
21  
22 MHA. The scoping review presented here serves as a precursor to this study. INForMHAA  
23  
24 particularly focuses on the role of the Approved Mental Health Professional (AMHP) under  
25  
26 the MHA. Usually drawn from a social work background (Skills for Care, 2022), the AMHP  
27  
28 role is distinct from that of the (usually) two doctors responsible for assessing whether the  
29  
30 individual has a mental health disorder. The AMHP has the responsibility to gather  
31  
32 necessary information from the person assessed through an interview to reach a decision  
33  
34 about whether the person should be detained or not. In doing so, the AMHP must consider all  
35  
36 the relevant factors surrounding the individual's context, including social and familial  
37  
38 circumstances, which then informs the outcome of the assessment.  
39  
40  
41  
42  
43  
44

45 The AMHP role is predicated on effective interpersonal communication with the assessed  
46  
47 person to discern their views and understanding of what is happening to them. For this  
48  
49 reason, a specific clause was added in statutory guidance, requiring that the interview  
50  
51 conducted as part of the assessment be carried out "in a suitable manner" (Section 13 (2)  
52  
53 MHA, 1983). In fact, statutory guidance that accompanies the MHA explicitly highlights the  
54  
55 need to ensure appropriate communication for groups who might have difficulties in  
56  
57 communicating effectively (Department of Health, 2015, paragraphs 4.4 and 14.42) with  
58  
59  
60

1  
2  
3 delegated responsibility to source and provide spoken/signed language interpreters where  
4 required. This provision was originally inserted to safeguard the rights of individuals whose  
5 first language may not be English and to prevent the possibility of unlawful detention based  
6 on ineffective communication (Jones, 1991, p.48). Such factors might include  
7 physical/sensory impairments, cognitive disabilities, or a language difference.  
8  
9

10  
11 Despite this emphasis on meeting communication needs, there is no requirement to  
12 systematically report the language used in a MHAA, in contrast to the recording of gender  
13 and ethnicity. Additionally, there is no evidence gathered as part of the UK minimum data set  
14 used to analyse the outcomes of MHAAs (NHS Digital, 2022b) indicating whether an  
15 interpreter was involved in an assessment. Consequently, the impact of interpreter-mediated  
16 MHAAs is unknown, which is particularly concerning given the current data on differential  
17 rates of detentions under the MHA according to ethnicity and cultural heritage (Barnett,  
18 2019). While the majority of individuals from diverse ethnic backgrounds would not  
19 necessarily utilise languages other than English in a MHAA, it is important to acknowledge  
20 that there are some who may, particularly among new arrivals as well as refugees and asylum  
21 seekers (Migration Observatory, 2019). According to the Office of National Statistics (ONS,  
22 2022) census data for England and Wales, 8.9% (5.1 million people) did not report English as  
23 their main language. Within this group, 43.9% (2.3 million) could speak English very well,  
24 35.8% (1.8 million) could speak English well, 17.1% (880,000) could not speak English well,  
25 and 3.1% (161,000) could not speak English at all. Furthermore, in 2020-2021, there were  
26 over 53,000 detentions under the MHA in England and Wales (Statista, 2023). Given the  
27 diverse language abilities within this population, it seems reasonable to assume that a number  
28 of MHAAs may require the assistance of an interpreter.

47  
48  
49  
50  
51  
52  
53  
54  
55

56  
57 In MHAAs, as is the case in other forms of psychological assessments, effective  
58 communication serves as a key tool for gaining insights into the individual's mental state,  
59  
60

1  
2  
3 identifying potential underlying factors contributing to their distress and symptoms, and  
4  
5 interpreting the significance of their behaviour (Weber et al., 2022). This involves actively  
6  
7 considering the language used by the individual and how it may be affected by, or linked to,  
8  
9 the individual's mental health condition (Cambridge et al., 2012). Moreover, fostering an  
10  
11 effective relational understanding between the assessor and the person being assessed is also  
12  
13 crucial for comprehending the individual's mental health and well-being (Rodríguez-Vicente,  
14  
15 2021). This not only facilitates a meaningful assessment but also ensures that the person feels  
16  
17 heard, understood, and supported throughout the evaluation process. Consequently, this  
18  
19 contributes to more effective communication, a key factor in achieving equitable outcomes  
20  
21 (Tribe & Thompson, 2022). Studies outside of the specific context of MHAAs have  
22  
23 demonstrated that failure to communicate in a language other than a person's primary, or  
24  
25 preferred, language may result in an incomplete or distorted evaluation of their mental state  
26  
27 (Casas et al., 2012). Additionally, the extensive body of literature on interpreter-mediated  
28  
29 encounters in various health and social care settings suggests that the effectiveness of such  
30  
31 interactions significantly relies on the quality of collaborative working dynamics between the  
32  
33 provider and the interpreter (Geiling et al., 2021). While this collaborative working dynamic  
34  
35 is an aspirational overarching principle, its interpretation may vary depending on the unique  
36  
37 needs and characteristics of each setting (Hsieh et al., 2013).

## 45 *2.2 Approach: why a scoping review?*

46  
47 In seeking to assemble and review existing evidence concerning interpreter-mediated  
48  
49 MHAAs as a precursor to the wider INforMHAA study, there were three considerations.  
50  
51 Firstly, the topic constitutes a specialised field within the broader discipline of interpreting  
52  
53 studies, distinct from more established domains of mental health interpreting, such as  
54  
55 psychological therapy. Nonetheless, some of the literature concerning interpreter practice in  
56  
57 mental health assessments more generally may be of relevance even if not formally linked to  
58  
59  
60

1  
2  
3 this specific context. Thus, the boundaries of the field under study and review are not strictly  
4 clear-cut. Secondly, practice knowledge may not be confined solely to formal literatures, with  
5 empirical studies of this specific topic likely to be rare; consequently, a broad and inclusive  
6 approach was deemed necessary to identify and consider a potentially fragmented body of  
7 work. Thirdly, the study for which the intended review was a precursor was firmly  
8 associated with practice under one specific legislation, the MHA, and in one geographical  
9 context (England and Wales). Yet, valuable insights, evidence sources, and potentially best  
10 practices were anticipated from an international context where similar legislation and  
11 practices exist. Considering these factors, a scoping review approach was selected to address  
12 the questions outlined in the following section.

13  
14  
15  
16

Scoping reviews have gained increasing prominence as a robust evidence-based methodology within various literature domains, particularly in the fields of medicine, healthcare, and social work/social care practice (Bradbury-Jones et al., 2022). They find their most valuable application in situations where the existing research literature is limited, rendering systematic reviews less insightful, and where professional practice knowledge exists but may be more commonly found outside of the empirically driven literatures (Grant and Booth, 2009). The approach adopted in scoping reviews stands in contrast to systematic reviewing and meta-analyses, which primarily focus on assessing the quality and depth of existing research evidence, as illustrated in the interpreting field in the work of Brisset et al. (2013), Krystallidou et al. (2020) and Theys et al. (2020). By contrast, the essence of a scoping review lies in collating the breadth of available knowledge, which often extends into grey and informal literature, typically addressing questions of professional uncertainty (Arskey and O'Malley, 2005). Considering all these factors, the incorporation of a scoping review into the field of interpreting studies is anticipated to make a contribution by mapping information

from diverse sources across various domains pertaining to the under-researched area of statutory mental health assessments.

### 3. Method

The review method followed the revised Joanna Briggs Institute scoping review framework (Peters et al., 2020) consisting of title and review questions; inclusion criteria; definition of participants/concept/context; search strategy; evidence screening and selection; data extraction (including charting); data analysis (synthesis); presentation of results; and conclusions. This framework is expanded from Arksey and O'Malley (2005) and Levac et al. (2010) and is reported in accordance with the PRISMA-ScR guidelines (Tricco et al., 2018). The protocol for the scoping review has been pre-registered on the international platform INPLASY, with the reference number: INPLASY20220086.

#### 3.1 Defining the research questions

The PICo approach (Population Interest Context) (Richardson et al., 1995) guided the formulation of the research questions.

**Table 1:** PICo process for formulation of research questions

<b>P: Population of interest</b>	<ul style="list-style-type: none"> <li>• Those who are assessed under the MHA or internationally equivalent legislation</li> <li>• Mental health professionals involved in the assessment with specific reference to AMHPs (and similar roles internationally)</li> <li>• Spoken and/or signed language interpreters involved in such assessment.</li> </ul>
<b>I: Interest</b>	<ul style="list-style-type: none"> <li>• Evidence concerning the type and quality of interprofessional working and its impact on both the process and outcome of formal assessments under the Mental Health Act 1983 and international equivalents.</li> </ul>

	<ul style="list-style-type: none"> <li>• Guidance for interpreter-mediated MHAAs and their international equivalents</li> </ul>
<b>Co: Context</b>	<ul style="list-style-type: none"> <li>• Statutory assessment under the MHA or its international equivalents</li> <li>• The actual practice of the assessment when AMHPs (and international equivalents) and interpreters are required to work together, and the person being assessed is not a user of the primary language in which the assessment is conducted.</li> </ul>

In the specified context of interest, namely the professional practice between AMHPs (and their international equivalents) and interpreters within the non-medical interview components of the MHA assessment (and its international equivalents), the guiding research questions of the scoping review are:

1. What are the enablers and barriers to good practice in interpreter-mediated MHA (1983) assessments (and their international equivalents)?
2. To what extent and how might interpreter mediation support or impede the legal rights and best interests of those assessed under the MHA (1983) (or its international equivalents)?

### *3.2 Definition of terms for the purposes of scoping review*

In order to carry out the scoping review, it was necessary to define key terms that were used to search the literature. Firstly, as noted earlier, the “Mental Health Act (1983)” refers to the formal legislation in England and Wales concerned with compulsory assessment, treatment and/or detention of those experiencing mental illness and who present as a danger to themselves or others. The MHA is undergoing a process of review with the publication of a draft Mental Health Bill in 2022. No new legislation has been enacted at the time of writing this article. “International equivalents” refer to parallel pieces of legislation for the same

purpose and with the same or similar powers that exist in other countries, although the exact details of the provisions contained within them may not be identical (Fistein et al., 2009).

In this paper we understand “translation” as a superordinate term, which refers to written, spoken and signed processes of meaning transfer. However, we acknowledge the common misuse of the term in the field of health and social care to refer solely to interpreters working in live mediated events, which is why the terms translation and interpreting were included in the review. Additionally, in this review we focus on the work of professional “interpreters”, which excludes interpreting activities performed by bilinguals who have had no formal training, may interpret or broker on an ad hoc basis, and/or are not remunerated for their work as interpreters (Napier, 2021).

### 3.3 Search criteria

For inclusion / exclusion criteria applied to the initial search of the literature see Table 2.

**Table 2:** Search inclusion and exclusion criteria

Variable	Inclusion Criteria	Exclusion Criteria
<b>Date range</b>	1 <sup>st</sup> January 1980 – 31 <sup>st</sup> March 2022	Literature published before 1980 refers to the preceding MHA of 1959 and likely to catch former legislations elsewhere that are no longer current.
<b>Design/study type</b>	All study designs including literature reviews, peer reviewed quantitative, qualitative and mixed method studies	None
<b>Sources</b>	Peer reviewed journal articles. Pre-prints. Book chapters. Grey literature including working papers, statutory guidance, legislation, professional guidance,	Literature produced by lobbying organisations and groups. Social media posts.

Variable	Inclusion Criteria	Exclusion Criteria
	regulatory/governmental reports. Student doctoral theses.	
<b>Language</b>	Publications in English, French, Spanish, German, Dutch, British Sign Language (BSL), American Sign Language (ASL) and International Sign. [The languages of the study team]	Those outside of the inclusion criteria.
<b>Location</b>	Pertaining to any country and research carried out in any international location.	None
<b>Focus of Study</b>	<ol style="list-style-type: none"> <li>1. The MHA in England and Wales and/or its national or international equivalents AND interpreting and translation within such assessments.</li> <li>2. The role of AMHPs in these contexts in relation to practice and outcomes particularly with respect to working with interpreters.</li> <li>3. Other language concordant professionals and roles including cultural advocates in MHAAs and their international equivalents.</li> <li>4. Signed and/ or spoken language interpreting.</li> </ol>	<ol style="list-style-type: none"> <li>1. General literatures on interpreting and translation in mental health that are not of relevance to statutory contexts.</li> <li>2. General research concerning the professional practice in MHAAs and their international equivalents that does not concern interpreting and translation.</li> <li>3. Literature focussing on family members associated with MHAAs and their international equivalents.</li> <li>4. Work focussing on discourse analyses</li> <li>5. Items focused primarily on the linguistic aspects of interpreting and translation</li> </ol>
<b>Service user group</b>	Adults assessed under the MHA and its international equivalents who are assessed in circumstances where an interpreter is required.	1. Work concerning children and young people covered by this legislation.

Variable	Inclusion Criteria	Exclusion Criteria
		2. Patients undergoing statutory assessments that involve potential deprivation of liberty conditions but which are not covered by the MHA or international equivalents.
<b>Workforce Roles</b>	1. AMHPs working within the MHA and their international equivalents. 2. Professional interpreter of a spoken or signed language	1. Family members or friends acting as interpreters 2. Translators who do not carry out interpreting

### 3.4 Search terms and strategy

We entered keyword synonyms using data base thesauri (MeSH entry terms in PubMed) and search terms with database-appropriate syntax, parentheses, Boolean operators AND/OR for search strings, and field codes were specified. The key concepts and synonyms are listed in Table 3; search terms and the Boolean operators used in Table 4.

**Table 3:** Concepts and descriptors

The data bases searched were: PubMed, ASSIA (Applied Social Sciences Index and Abstracts) PsycINFO (American Psychological Association), Web of Science (Clarivate), CINAHL (Cumulative Index to Nursing and Allied Health Literature), Social Care Online, and EThOS. Additionally, we searched the online indices of twenty six specific journals where publications on this topic were likely to be placed across the disciplines of social work, allied health professions, translation and interpreting and sign language/deaf studies as well as subject-specific publisher websites using key terms so we could capture book chapters (see Appendix 1 in Supplemental Material alongside this article for a full list). A targeted search focused on grey literature was largely based on the research team's own professional knowledge encompassing NHS Digital, NHS England, the Care Quality Commission, legislation and statutory guidance in mental health, professional resources and publications for public sector spoken language interpreters and for signed language interpreters.

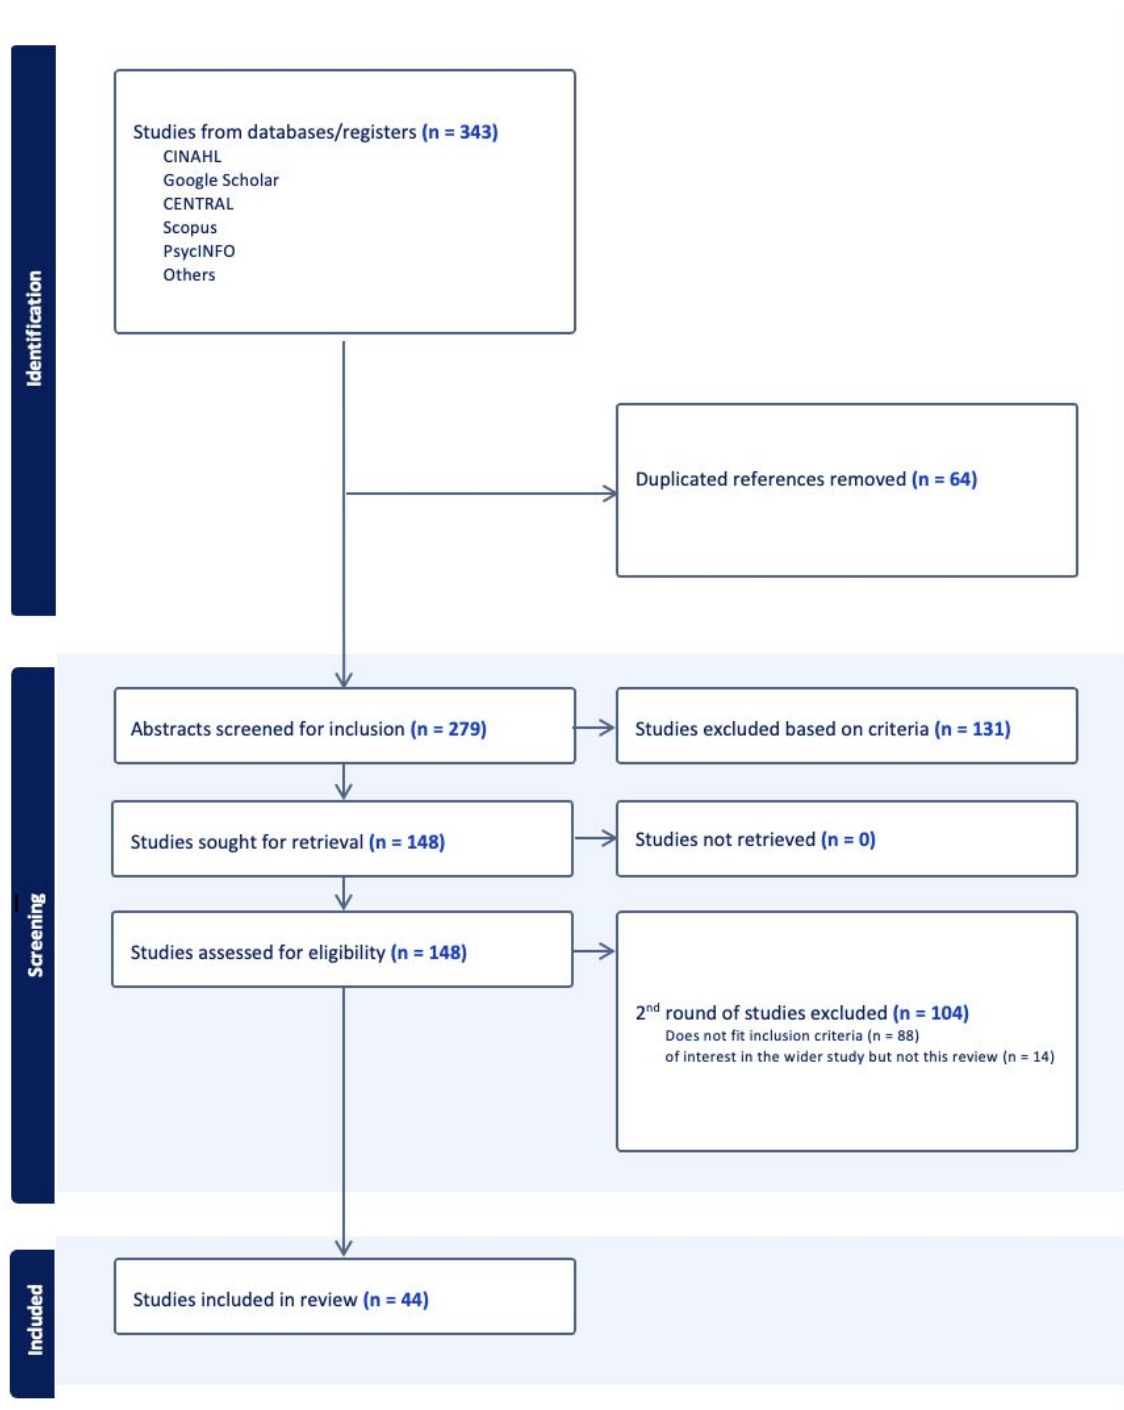

### *3.5 Identification and selection of relevant studies*

The online systematic reviews software Covidence was used to assist with the importing and screening of citations. Selection followed a two-stage process: (i) title and abstract screening was carried out by three reviewers (AY, JN, SV). Any item classified 'maybe', or where a conflict of opinion between the reviewers occurred, was subjected to a discussion to reach a consensus of yes or no; (ii) full text screening, by reviewers (AY, RT) with a third (NRV) acting as an independent reviewer to resolve any items classified as 'maybe' or where conflict required further discussion to reach consensus. Screening at both stages required the

1  
2  
3 involvement of a team member with expertise in interpreting and another member with a  
4  
5 background in mental health social work. This professional as well as academic judgement  
6  
7 was crucial in ensuring that literature was selected of relevance to the questions guiding the  
8  
9 review even if not directly addressing statutory mental health assessment. It also allowed for  
10  
11 the inclusion of work that was addressing the statutory context from the perspective of mental  
12  
13 health professionals where interpreting/translation was highly pertinent but totally absent  
14  
15 from the approach within the work. A scoping review that seeks to map out a territory where  
16  
17 there is little pre-existing work has the flexibility to take this approach in a way that a  
18  
19 systematic review would not. Reasons for exclusion at either stage of study selection were  
20  
21 recorded. After duplicates were removed, 279 items were identified at stage one screening.  
22  
23 131 were excluded and 148 progressed to full text screening. 104 were excluded at this point  
24  
25 leaving 44 which were retained for review (Figure 1).

### 3.6 Charting and tabulation

A bespoke charting template was created in Microsoft Excel combining elements of the charting template available in Covidence, which is more suitable for intervention studies, and one available through the Joanna Briggs Institute (Evans et al., 2019), which encompasses a wider range of study designs and types of literature. The study characteristics charted included: (a) authors, year of publication; (b) category of publication: empirical study, literature review, grey literature, book chapters/book; (c) country the work relates to; (d) key findings or main patterns relevant to the review. These categories are reflected in Table 5 below.

## 4. Results

### 4.1 Characteristics of included items

Results of the charting phase are presented in Table 5 below. This includes a statement about whether issues of language/communication/interpreting were included within the article's focus explicitly given the relevance of the topic addressed.

#### 4.1.1 Type of literature

Of the forty-four items reviewed in the final stage, twenty-four are grey literature items, ten are empirical studies, six are literature reviews, and four are classified as 'other'.

Amongst the grey literature items, three sub-groups can be differentiated. The first sub-group consists of fifteen items, which are publications by government and statutory bodies (such as the Care Quality Commission). The second sub-group consists of seven professional guidelines documents, with five targeting mental health professionals and two targeting interpreters. The third sub-group consists of two online reports on legal matters.

Out of the ten items featuring empirical data, seven concern aspects of AMHP professional practice, and three concern interpreters working in mental health contexts. Among these

empirical items: one is quantitative in design, one is a retrospective study of patient visits, two are mixed methods, combining surveys, interviews, and focus groups. The remaining six empirical studies follow a qualitative methodology involving interviews with sample sizes ranging from ten to thirty-three participants.

Out of the six literature reviews: two are narrative reviews, two are scoping reviews, and two are systematic reviews. Regarding their thematic scope, two of the reviews concern AMHP practice, and three reviews are about the involvement of interpreters in mental health in general and the impact of language mediation on the quality of care. Finally, one review concerns ethnic variations in compulsory detention under the MHA.

#### 4.1.2 Items by country

Among the ten empirical items, seven were generated by UK-based universities, one in Ireland, one in the US, and one in South Africa. Regarding the six literature reviews, two had a UK focus, two had a US focus, and two had an international focus. For the seven professional guidelines, four originated in the UK, and three in Australia. The remaining grey literature items, comprising government and statutory bodies' reports, have a UK focus.

**Table 5: Characteristics of selected items**

Author	Country	Title	Category	Focus	Findings
#214 <sup>1</sup> O'Hare et al. (2013)	UK	Implementing mental health law: A comparison of social work practice across three jurisdictions	Empirical: Qualitative exploratory using vignettes. 28 participants	The social worker role in implementing mental health law.	Variations in legal and policy frameworks created differing viewpoints among mental health social workers on the implementation of laws in their respective jurisdictions, particularly around risk assessments and intervention. No mention of participants'

<sup>1</sup> Numbers following a hashtag reference the original number label in the review software 'Covidence', used to support this review.

Author	Country	Title	Category	Focus	Findings
					experience with linguistically and culturally diverse people.
#57 Watson (2016)	England and Wales	Becoming an Approved Mental Health Professional: An analysis of the factors that influence individuals to become Approved Mental Health Professionals	Empirical: 12 qualitative semi structured interviews	The personal, professional, and social factors that influence individuals to become AMHPs.	Career advancement and professional growth, exercising independent judgement and job security, are essential considerations. No mention of language/culture issues.
#212 Davidson et al. (2021)	Northern Ireland	Mental health law assessments: Interagency cooperation and practice complexities	Empirical: Audit. 189 assessments	Routine practice and identification of outstanding issues as a basis for policy and guidance development.	Coordinating professionals, resource pressures, interprofessional collaboration. Language/culture/ethnicity not a concern in policy guidance.
#13 Dixon et al. (2019)	England and Wales	Treading a tightrope: Professional perspectives on balancing the rights of patients and relatives under the MHA in England	Empirical: Questionnaires and focus groups. 55 participants	AMHP interpretations of their legal responsibilities towards the Nearest Relative.	Balancing the rights of people assessed and the Nearest Relative was challenging. No discussion of potential language differences.
#205 Abbott (2021)	England and Wales	A study exploring how social work AMHPs experience assessment under Mental Health Law: Implications for Human Rights-oriented social work practice	Empirical: 11 qualitative interviews.	Experiences of AMHPs in conducting MHAAs and implications of these experiences for human rights-oriented social work practice.	AMHPs face difficulties when attempting to reconcile legal frameworks with a human rights-based approach. Language differences not considered in ethical challenges around the person's <i>voice</i> being diminished during the process of assessment.
#7 Hemmington et al. (2021)	England and Wales	Approved Mental Health Professionals, best interests assessors and people with lived experience: An exploration of professional	Empirical: Mixed methods 258 AMHPs, 248 BIA assessors. 18 service users/relatives/carers	The professional identity and practice of AMHPs and Best Interests Assessors in relation to people with lived experience of mental health issues.	Highlights the importance of effective communication and collaboration between mental health professionals and people assessed/Nearest Relative. Does not mention potential

Author	Country	Title	Category	Focus	Findings
		identities and practice			relevancy of language/cultural differences.
#145 Zimányi (2013)	Ireland	Somebody has to be in charge of the session. On the control of communication in interpreter-mediated encounters	Empirical: Semi structured qualitative interviews. 11 MH workers 12 Interpreters	The power held by MH professionals and interpreters as illustrated by patterns in communication control behaviours.	Control dynamics between interpreters and MH professionals identified but not in relation to statutory contexts.
#119 Flynn (2013)	USA	Primary care utilization and mental health diagnoses among adult patients requiring interpreters	Empirical: Retrospective secondary data analysis. Adult outpatients (n=63,525)	Utilization patterns of healthcare services and prevalence of mental health diagnoses among adult patients who require interpreters compared to those who do not require interpreters.	Patients needing interpreters had a higher mean number of hospital visits overall, a lower frequency of mental health diagnoses but higher frequency of diagnoses recognised as potential <i>somatic</i> symptoms. No data on statutory MH assessments.
#133 Drennan and Swartz (2002)	South Africa	The paradoxical use of interpreting in psychiatry	Empirical: Ethnographic exploration	The role and influence of interpreters on psychiatric diagnosis and institutional management of patients with other languages.	When no shared language with the clinician: (i) a greater tendency to view the patient as exhibiting cognitive impairment or thought disorder (ii) psychiatrists often used the interpreter's opinion of the patient as a form of clinical assessment. No discussion of involuntary admission.
#11 Simpson (2020)	England and Wales	A structured narrative literature review of Approved Mental Health Professional detention decisions: An infusion of morality	Literature review: Narrative	Review of detention decisions by AMHPs	This review highlights risk, accountability, and morality and sub-themes of emotions, intuition, uncertainty, coercion, and alternatives (to hospitalisation). No reference to language/culture/ethnicity.
#12 Buckland (2020)	England and Wales	Power as perceived in MHA assessment	Literature review: Scoping	Participants in MHAAs (assessing team, service users)	MHAAs are frequently characterised by inequality among

Author	Country	Title	Category	Focus	Findings
		contexts: A scoping review of the literature		and carers) and power relationships.	participants, despite a policy emphasis on collaboration and recovery. Power inequalities in language/culture/ethnicity not discussed.
#229 Flores (2005)	United States	The impact of medical interpreter services on the quality of health care: A systematic review	Literature review: Systematic	The impact of interpreter services on quality of care.	Health care quality is compromised when untrained interpreters in medical encounters with LACD patients, with serious consequences for patients with mental disorders. No discussion of statutory MH assessment.
#42 Fennig and Denov (2001)	International	Interpreters working in mental health settings with refugees: An interdisciplinary scoping review	Literature review: Scoping	Peer-review of 84 studies on interpreters working in MH settings with refugees.	Interpreter provision in MH contexts has a positive impact on refugee clients' quality of care and clinical outcomes. No mention of statutory MH assessments.
#249 Searight and Russell (2013)	United States	Foreign language interpreters in mental health: A literature review and research agenda	Literature review: Narrative	Interpreters in MH settings.	Most of the literature focuses on providing clinical guidelines for interpreters. Discussion of impact of interpreter mediation in accuracy of psychiatric diagnosis but no reference to statutory MH assessments.
#21 Barnett et al. (2019)	International	Ethnic variations – mental health compulsory detention	Literature review: Systematic	Incidence of involuntary detention among BAME and migrant communities in the UK and other parts of the world.	BAME and migrant communities face a higher likelihood of being subjected to psychiatric detention although risk varies among different ethnic groups. This work only focuses on ethnicity and does not address any potential impact of language differences or interpreter utilisation on detention rates. Minor mention of language barriers as a potential explanatory factor for disparities in detention.

Author	Country	Title	Category	Focus	Findings
#18 Tribe and Lane (2009)	UK	Working with interpreters across language and culture in mental health	Other: Commentary	Challenges and opportunities involved in working with interpreters in MH.	Highlights hospital managers have a statutory duty to provide information to patients and Nearest Relative about detention, consent to treatment, rights of appeal and other legal matters thus providing interpreters if necessary.
#33 Bot (2015)	The Netherlands	Interpreting in mental health care	Other: Book chapter	Interpreters' role and involvement in MH encounters, and joint working dynamics between MH professionals and interpreters.	Interpreters move across a continuum of interaction in psychological therapies and communication with psychotic patients. No mention of statutory MH assessments.
#2 Carney (2021)	England and Wales	MHA assessment, sectioning, Tribunals and Lay Managers' Hearings	Other: Book chapter	Practical guidelines for professionals working with deaf or hard of hearing people in a set of statutory MH settings including MHAAs	In case of language discordancy with a deaf person, the MH professional must work with a registered/experienced interpreter and with a relay interpreter in the case of language dysfluency. Interpreters need to be supported in their preparation. Online interpreters are crucial in assessments where an in-person interpreter might not be provided on time. Good communication must also be provided following the MHAA in the admission process, also the Nearest Relative must be consulted by an AMHP in all cases if practicable.
#193 Wand et al. (2020)	New South Wales, Australia	Working with interpreters in the psychiatric assessment of older adults from culturally and linguistically	Other: Commentary	The dynamics involved in working with interpreters in MH assessments of older adults.	Professional interpreters have distinct advantages over ad hoc interpreters in the psychiatric assessment of older adults requiring language mediation,

Author	Country	Title	Category	Focus	Findings
		diverse backgrounds			but patients highly value the broader roles that family members may take when acting as interpreters. No mention to how this applies to statutory assessment contexts. .
#155 Miletic et al. (2006)	Australia	Guidelines for working effectively with interpreters in mental health settings	Grey	Instructions/suggestions for MH professionals working with interpreters.	Australian MHA states staff must ensure client rights are conveyed through interpreters in a MH environment. These guidelines recognise legal obligations under the MHA (Australia) may take precedence over other factors such as the wishes of the assessed person.
#8 ASLI (2020)	UK	Guidelines for Booking Interpreters in Healthcare Settings during the COVID-19 Pandemic	Grey	Guidelines for HC professionals when working with deaf patients and sign language interpreters during the COVID pandemic.	Within MHC, mention of the special needs of deaf sign language users assessed under the MHA and warns of the potential legal consequences of an incorrect assessment.
#158 Bevan (2018)	UK	Best practice guide for mental health practitioners working with BSL/English interpreters	Grey	Guidelines for MH professionals working with interpreters with the BSL-English	Specific mention made of AMHPs and MHAAs stating that the AMHP must arrange for the booking of an interpreter who is qualified and registered with a governing body with expertise in MH. Special mention made of thought-disordered language requiring particular expertise.
#156 Wilson et al. (2017)	Scotland	2018 Revision of the Mental Welfare Commission for Scotland - Good practice guide: Working with an interpreter	Grey	Guidelines for people involved in interpreter-mediated MH settings	Recognises the need for interpreters and interviewers to work as a team to achieve best outcomes, need to adapt to each context including MH Tribunals.

Author	Country	Title	Category	Focus	Findings
#328 Gloucestershire county council (2020)	England	Gloucestershire HSC trust – AMHP reporting guidelines	Grey	Document for AMHPs to provide the record of an MHA assessment.	Option to record language ‘normally used’ along with ‘ethnic origin’ and ‘culture’.
#178 Hlavac (2017)	Australia	Mental health interpreting guidelines for interpreters	Grey	Guidelines for interpreters to work optimally in MH interactions.	Definitions of MH terms, protocols, ethical considerations in MH, and list of patients’ rights and legal terms, medico-legal MH tribunals and MH legislation in Australian states, involuntary treatment orders, protection or rights.
#164 ASLIA (2011)	Australia	ASLIA Guidelines for interpreting in mental health settings	Grey	Reframes the ASLIA interpreters’ code of ethics to the specifics of working in mental health settings.	It provides a discussion of how regular interpreting practice ethical principles may develop in MH practice, mentions the need for an interpreter to have a pre-chat (briefing) with the clinician to ascertain the purpose of the session, e.g. involuntary treatment order. No specific discussion of best practice.
#331 NHS England (2020)	England and Wales	Legal guidance for mental health, learning disability and autism, and specialised commissioning services supporting people of all ages during the coronavirus pandemic	Grey	Guidelines in fulfilling statutory roles and responsibilities during the pandemic in England and Wales as part of the Coronavirus Act 2020.	This guidance, since expired, approved the lawful use of remote assessments during the coronavirus pandemic in some special circumstances. The focus on ‘very limited circumstances’ suggests that a remote assessment might be deemed unlawful and makes no mention of using (or not) interpreters remotely.
#338 Devon Partnership NHS Trust v Secretary of	England and Wales	England and Wales High Court - Case law on remote assessments	Grey: Case law	Revision of guidance on video assessments.	An AMHP must have “personally seen” the person Aligns with the Code of Practice in that direct personal

Author	Country	Title	Category	Focus	Findings
State for Health and Social Care					examination is the preferable method of examination through key phrases such as “personally seen” in s11(5) and “personally examined” in s12(1).
#339 BB v Cygnet Health Care Case Law (2015)	England	England and Wales High Court - Case law on relatives as interpreters	Grey: Case law	Inadequate consultation with Nearest Relative.	Questions the practice of an ASW (AMHP predecessor) of using a relative as interpreter
#16 Department of Health (2009)	UK (England)	Delivering Race Equality in mental health care: A review	Grey: Government report	Reports the work of the 5 year ‘Delivering Race Equality’ programme in England as it ends.	Provides an example of culturally appropriate services for psychosis acknowledging that some [people] revert to their own language to be able to express a particular thought or feeling and a second example of access to therapeutic services through use of interpreters. Neither are specific to MHA assessment.
#4 UK Government (2021)	UK (England and Wales)	Consultation outcome: Reforming the MHA	Grey: Government paper	Summary of Government proposals for review of MHA including policy and practice to improve the patient experience and a response to the independent review of the MHA.	Acknowledged some new ways of working since the pandemic including remote video consultation where appropriate and gives example of Second Opinion Doctor consultation. States Government’s wish to launch a programme of culturally appropriate advocates to better help those from all ethnic minority backgrounds to voice their individual needs but no specific mention of language or communication needs
#327 Care Quality Commission (2015)		MHA Code of Practice 2015 – An evaluation of how the Code is being used	Grey: Regulatory body report	Evaluation of how Code of Practice (Department of Health, 2015) is being used.	CoP is still not being used as intended and there is variation in provider understanding of it

Author	Country	Title	Category	Focus	Findings
					and how it should be used. Recommends development of standardised resources for patients, carers and staff, promoting the Code's principles of accessibility. Recommends learning from the Welsh Code of Practice's emphasis on evidence-based practice should underpin all learning.
#329 Care Quality Commission (2020)	England	Monitoring the Mental Health Act 2018/2019	Grey: national regulator report.	Annual audit of the use of the MHA reporting characteristics of those assessed, outcomes of assessment and data about the AMHP workforce.	No data are reported or required to be reported on the language(s) used during the MHA assessment, whether an interpreter, cultural advocate or any other language concordant professional was used. Ethnicity/cultural identity of the person assessed is recorded.
#333 Care Quality Commission (2022)	England	Monitoring the Mental Health Act in 2020/21	Grey: national regulator report.	Annual audit (update) of the use of the MHA reporting characteristics of those assessed, outcomes of assessment and data about the AMHP workforce.	No data are reported or required to be reported on the language(s) used during the MHA assessment, whether an interpreter, cultural advocate or any other language concordant professional was used. Ethnicity/cultural identity of the person assessed is recorded.
#337 Department of Health (2008)	England	Code of Practice Mental Health Act 1983	Grey: Government report	Statutory guidance for mental health professional in carrying out their duties and powers under the MHA 1983	Includes specific guidance on the requirement to interview 'in a suitable manner', allows for the provision of cultural advocates and relay interpreters, offers specific guidance with respect to Deaf BSL users during

Author	Country	Title	Category	Focus	Findings
					assessments. Does not include any similar extended guidance for those who require a spoken language interpreter.
#326 Department of Health (2015)	England	Code of Practice Mental Health Act 1983	Grey: Government report	Statutory guidance for mental health professional in carrying out their duties and powers under the MHA 1983.	Includes specific guidance on the requirement to interview 'in a suitable manner', allows for the provision of cultural advocates and relay interpreters, offers specific guidance with respect to Deaf BSL users during assessments. Does not include any similar extended guidance for those who require a spoken language interpreter.
#342 Welsh Assembly government (2008)	Wales	Code of Practice Mental Health Act 1983 for Wales	Grey: Statutory professional code of practice	Statutory guidance for mental health professional in carrying out their duties and powers under the MHA 1983 for Wales.	Includes specific guidance where a person's language is other than English or Welsh that assessment should be delivered through a trained interpreter who will address issues of both language and cultural interpretation, including use of BSL. If an interpreter is needed this should not normally be a relative or friend. Recommends support of an interpreter alongside an IMHA where there is a communication need.
#343 Welsh Assembly Government (2016)	Wales	Mental Health Act (1983) Code of Practice for Wales review	Grey: Statutory Code of Practice	Reviews the MHA 1983 Code of Practice for Wales – 2016 version.	'Every effort should be made' to provide a registered, qualified interpreter, if needed. Considers special expertise involved in interpreting thought-disordered language. Sets out professional and ethical principles for interpreters in MHAAs.

Author	Country	Title	Category	Focus	Findings
					Professionals should be aware immigration detainees may be particularly vulnerable and may need additional support, including reasonable adjustments including interpreter involvement.
#5 UK government (2018)	England and Wales	Modernising the Mental Health Act	Grey: Government initiated review report	Brings together and reports on the work of the Independent Review of MHA.	Finds that some service users may need assistance to express their views and preferences. Calls for more research into the lived experience of communities who are disproportionately detained. Refers to one AMHP's evidence of the experience of refugees and asylum seekers whose first language is not English.
#341 UK Parliament (2023) Joint Committee on the Draft Mental Health Bill	England	Draft Mental Health Bill 2022 - Report of the Joint Consultative Committee	Grey: Government report	Brings together work of the Joint Consultative Committee set up to review the draft mental health bill. Provides recommendations to the UK government.	Refers to one piece of oral evidence of the need to provide interpreters who understand cultural needs too but not followed up in recommendations.
#340 Department of Health and Social Care and Ministry of Justice of UK Government (2022)	England	Draft Mental Health Bill	Grey: Government report	Makes provision to amend and 'modernise' the MHA (1983).	No specific reference to interpreters.
#3 Smith (2021)	England and Wales	Government drops proposed overhaul of MHA-Mental Capacity Act interface due to 'very	Grey: Report in the professional press online General public	Reviews the (lack of) reform of MHA legislation.	Lack of support for change in MH legislation. Consequences: Remote assessments will continue to be unlawful (it does not clarify whether interpreting services

Author	Country	Title	Category	Focus	Findings
		limited support'			can be provided remotely). Concludes that further work on reforming the MHA must be conducted in particular to introduce legislation that addresses disproportionate detentions of individuals with BME backgrounds. Does not mention how language might contribute to those disparities.
#6 Carter (2021)	England and Wales	Video assessments by AMHPs unlawful	Grey: Report in the professional press online of a statutory review	Reports the outcome of a legal challenge to the Coronavirus easements that had permitted video, remote, online assessments under the MHA.	The 'Devon Ruling' concluded that the online remote video assessment under the MHA is unlawful. This ruling did not go as far to say any online interpreting without the interpreter being present is unlawful.
#334 NHS Digital (2002)	England and Wales	Government annual report	Grey	Reports the characteristics of those assessed under the MHA and reviews annual figures against previous years to identify trends.	No data are required to be reported on the language(s) used during the MHA assessment, whether an interpreter, cultural advocate or any other language concordant professional was used. Ethnicity/cultural identity of the person assessed is recorded.

## 5. Narrative synthesis of findings

We adopted the PAGER framework (Bradbury-Jones et al., 2022) to assist in the narrative synthesis of findings and their presentation. This tool was designed as a structured approach for synthesizing and articulating the findings. PAGER suggests that each item is considered under the headings of: 'Patterns', 'Advances', 'Gaps', 'Evidence for practice' and 'Recommendations'. It is especially suited to scoping reviews focusing on issues related to

1  
2  
3 professional practice. The PAGER framework goes beyond merely identifying themes; it  
4  
5 closely considers the context in which themes might emerge, interact and from whose  
6  
7 perspective – hence identifying patterns. Additionally, it emphasises the implications of what  
8  
9 is present and absent in the literature for advancing practice.  
10  
11

12  
13 The full PAGER table can be found in Appendix 2 in the Supplemental Material alongside  
14  
15 this article. The elements in this table assisted in the articulation of the main findings, set out  
16  
17 below, where three main patterns concentrated around: (1) interpreter-mediated MHAAs as a  
18  
19 missing focus; (2) implications of interpreting in statutory circumstances not being  
20  
21 recognised; and (3) a lack of consideration of the impact of language mediation in  
22  
23 contemporary AMHP practice.  
24  
25

### 26 27 *5.1. Interpreter-mediated MHAAs as a missing focus*

28

29  
30 A major finding of this review is that there is no pre-existing literature available that  
31  
32 specifically examines interpreter-mediated MHAAs, nor with respect to international  
33  
34 equivalents, whether in terms of practice or impact on outcome. The articles that have a broad  
35  
36 focus on mental health interpreting do not generally include extensive, if any, references to  
37  
38 involvement of interpreters in situations of compulsory detention or emergency practice  
39  
40 under the law. And even when such references are made, they are usually brief and  
41  
42 peripheral; for example, Tribe and Lane's (2009) reference to duties to provide linguistically  
43  
44 accessible information to those detained. Articles focussing on issues of AMHP practice, for  
45  
46 example, Leah (2019), Vicary, et al. (2019), Abbot (2021), Karban, et al. (2021) fail to  
47  
48 include any consideration of how linguistic or cultural mediation might be relevant to their  
49  
50 key findings. The absence of research evidence with a specific focus on the practice of  
51  
52 interpreter-mediated MHAAs creates a misleading perception that all MHAAs take place  
53  
54 within a monolingual context with shared language usage.  
55  
56  
57  
58  
59  
60

1  
2  
3 The failure to recognise the effects and potential influence of language on MHAA practice  
4 and outcomes, separate from those of cultural and/or ethnic identity, is widespread. The lack  
5 of annual reporting data on the language identities and language use of those assessed (NHS  
6 Digital, 2022a), and whether interpreters or other language concordant professionals were  
7 required is stark. It could be argued that this demonstrates how little value is given to the  
8 language of the person and the assessment as potential axes of inequality within the MHAA  
9 process. This failure to attend to language differences is reinforced in the literatures  
10 surrounding the reforms to the MHA with language considerations only featuring with  
11 respect to translations of written texts/information for patients or special considerations for  
12 those who are deaf (UK Parliament, 2023). In the most recent report from the Joint  
13 Consultative Committee on the Draft Mental Health Bill (2023), the body set up to scrutinise  
14 the draft mental health bill, the brief mentions of interpreting are subsumed under  
15 considerations of advocacy for the person assessed, rather than identified in their own right  
16 (UK Parliament, 2023). The diminishment of the potential influence of interpreter-mediation  
17 on the practice and outcomes of MHAAs is systemic. For example, the easements under the  
18 Coronavirus Act 2020 in the UK that briefly permitted remote MHAAs were eventually  
19 judged unlawful in part because of the negative impact on judgements, interaction and  
20 communication (see NHS England, 2022). Remote interpreting is still widely practiced in  
21 MHAAs (Young et al., 2023). However, the impact of a 'disembodied voice' during an  
22 assessment on someone already experiencing mental health distress, which could result in the  
23 deprivation of liberty, remains unquestioned. Why would the unlawfulness associated with  
24 whether an assessment can be correctly carried out remotely under the MHA not also apply to  
25 the circumstances of remote interpreting? This is an area of practice research that clearly  
26 requires further work. The gap in the evidence-based practice literature, practice guidance  
27  
28

1  
2  
3 and statutory reporting is, however, not confined to the UK. The lack of attention extends  
4  
5 internationally and thus, the scarcity of research directly in this area is of global concern.  
6  
7

8 A second aspect related to ‘interpreter-mediated MHAAs as a missing focus’ concerns the  
9  
10 characteristics of the available literature and the clear scarcity of empirical studies relating to  
11  
12 interpreter mediation in MHAAs and their equivalents. Empirical research plays a vital role  
13  
14 in advancing knowledge and the absence of it limits the ability to draw evidence-based or  
15  
16 evidence-informed recommendations for practice. While numerous guidance documents, both  
17  
18 statutory and non-statutory, emphasise the need for best practices, including proper  
19  
20 assessments as required by legislation, the preference for professionally qualified interpreters,  
21  
22 and the duty to make provisions for them (ASLIA, 2011; Carney, 2021; Department of  
23  
24 Health, 2015, Department of Health, 2008; Hlavac, 2017; Welsh Assembly Government,  
25  
26 2008), these documents do not constitute an evidence base for practice, neither for  
27  
28 interpreters nor for AMHPs.  
29  
30  
31  
32

### 33 34 *5.2 The implications of interpreting in statutory circumstances not being recognised* 35

36  
37 The findings of this review suggest that the prevailing body of research in interpreting studies  
38  
39 does not adequately distinguish research, guidelines or practice recommendations that apply  
40  
41 in mental health statutory contexts, such as the MHA, from general work on interpreting in  
42  
43 mental health. Most of the literature available refers to interpreter-mediation in  
44  
45 psychotherapeutic (Bot, 2015) or psychiatric (Drennan and Swartz, 2002; Wand, 2020)  
46  
47 practice whether in assessment, evaluation or treatment and therefore does not recognise  
48  
49 distinctive issues at stake in statutory assessments. This applies both to empirical studies and  
50  
51 professional guidelines. Some of the issues prevailing in existing mental health interpreting  
52  
53 literature include (i) the interpreters’ role, agency and visibility including ethical dilemmas in  
54  
55 relation to those, (ii) links between language, culture, and mental health, (iii) challenges  
56  
57 around ensuring accuracy in mental health, e.g., in the case of cross-cultural equivalents, (iv)  
58  
59  
60

1  
2  
3 the impact of language mediation on mental health practice including assessments and (v)  
4 interpersonal dynamics. In the literature reviewed, none of these issues is addressed in the  
5 context of MHAAs and the special conditions that may pertain to emergency or statutory  
6 practice under the law. As a result, this scoping review highlights the need for research that  
7 explores how long-standing debates and current expertise in the field of interpreting studies,  
8 particularly mental health interpreting, apply to statutory mental health assessments and by  
9 extension to other statutory practice. This would lead to generating new insights and  
10 perspectives on the topic which would, in turn, advance the field of interpreting studies. This  
11 is because interpreting in the context of MHAAs presents distinct challenges that necessitate  
12 specialised attention, such as interpreting complex legal terminology, the role, responsibilities  
13 and powers of professionals conducting MHAAs, and the interpreting of potentially  
14 disordered language output of people severely affected by mental health conditions, within  
15 the context of potential involuntary detention under the law.

16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33  
34 This lack of recognition of the particular nature of mental health interpreting in relation to  
35 statutory mental health contexts such as MHAAs is also present in existing guidance for  
36 interpreters. Some do mention special legal considerations and associated concepts, or ethical  
37 considerations that might be pertinent to MHAAs (ASLIA 2011; 2020; Hlavac, 2017),  
38 however, they do not comprehensively address the unique considerations, procedures, and  
39 challenges encountered in statutory mental health assessment under whatever jurisdiction.  
40  
41

57  
58  
59  
60  
The absence of detailed guidance for interpreters in situations of mental health crises and  
collaboration with professionals under legal obligations poses a challenge. The scarcity of  
explicit practice frameworks may impact interpreters, influencing their performance and  
compromising the overall quality of the assessment process, particularly in relation to legal  
aspects. Additionally, the lack of existing literature raises concerns regarding the preparation,

1  
2  
3 training, and support provided to interpreters working in statutory mental health contexts,  
4 including the absence of these matters within generic interpreter training programmes.  
5  
6  
7

8 This scoping review also identified a lack of literature on the need for collaborative working  
9 practices between AMHPs (or equivalents) and interpreters in MHAAs (or equivalents). This  
10 is important because there is some evidence (from non-statutory mental health services) to  
11 suggest that interprofessional collaboration between mental health practitioners and  
12 interpreters can lead to positive outcomes (Gryesten et al., 2023). However, there is a gap in  
13 the existing literature on the specific strategies and techniques that AMHPs and interpreters  
14 can use to effectively collaborate during MHAAs, in which the legal aspect is especially  
15 salient. Moving beyond academic literature and guidelines, statutory documents paint a  
16 similar picture: while the statutory code of practice accompanying the MHA (Care Quality  
17 Commission, 2015; Department of Health, 2008 Department of Health, 2015, Welsh  
18 Assembly Government, 2008, Welsh Assembly Government, 2016) does offer certain  
19 guidance regarding the situations that call for the involvement of an interpreter, it falls short  
20 of providing specific instructions on how AMHPs can effectively collaborate with  
21 interpreters. The existing guidance primarily focuses on determining when interpreter  
22 assistance is required, rather than offering specific guidance on optimising the working  
23 relationship between AMHPs and interpreters. The potential dissonance that AMHPs may  
24 experience when conducting assessments through an interpreter, assumptions that might be  
25 made regarding interpreters' level of knowledge about core legal concepts and their  
26 implications, for instance, will require carefully considered practice responses. Guidance that  
27 supports AMHPs to jointly navigate the complexities of meaning making in MHAAs as  
28 opposed to viewing interpreting as a bolt-on mechanism, or a 'conduit', would not only  
29 enhance AMHP confidence in interviewing 'in a suitable manner' and reaching a decision on  
30 outcomes, but would also have associated benefits for the experience of people assessed.

### 5.3 Lack of consideration of impact of language mediation in contemporary AMHP practice

The parameters of the scoping review include available empirical research on the challenges involved in AMHPs professional practice, in order to identify the extent to which challenges associated with language mediation might be recognised. It was notable to find that challenges associated with the need for language mediation have been largely overlooked in the existing body of research that focuses on contemporary AMHP practice.

The current literature predominantly focuses on various challenges that AMHPs encounter in their work, such as effectively managing risks (Simpson, 2020), navigating complex legal frameworks (Abbott, 2021; Fish, 2022), safeguarding the rights and autonomy of individuals undergoing assessment and rights of the Nearest Relative (Dixon et al., 2019), and fostering collaborative relationships with other professionals during the coordination of MHAAs (Davidson et al., 2021). These studies shed light on AMHPs' awareness of the ethical dilemmas inherent in wielding statutory powers, including striking a balance between autonomy and safety, managing power dynamics, managing the complexities of their coordinating role, and grappling with time constraints.

It was notable that in all these studies, which admittedly had a different focus than our topic of interest, there was not even a passing consideration given to whether and how the points being made might be impacted by practice that is not monolingual. This absence is remarkable given that previous research has found that language mediation might challenge standard communicative practices in social work in ways that practitioners do not have the resources to address affectively (Tipton, 2016). The specific challenges faced by AMHPs in such interpreter-mediated assessments are multifaceted. The presence of interpreters introduces a layer of complexity for AMHPs that can impact the accuracy and reliability of information exchanged. A higher potential for misinterpretations, omissions, or

1  
2  
3 misunderstandings can occur, potentially compromising the overall assessment process and  
4  
5 subsequent decision-making. This is particularly salient in the case of acute mental health: for  
6  
7 example, the MHA Code of Practice (Section 14.116-117), states that the AMHP involved in  
8  
9 the assessment should be responsible for booking and using registered qualified interpreters  
10  
11 with expertise in mental health interpreting, bearing in mind that the interpretation of  
12  
13 thought-disordered language requires “particular expertise”. However, the specific skills and  
14  
15 expertise required to effectively interpret thought-disordered language, particularly in the  
16  
17 context of an MHAA, are not thoroughly examined in the existing body of knowledge.  
18  
19 Thought-disordered language, often observed in individuals with severe mental health  
20  
21 conditions, is likely to pose unique challenges for interpreters because of the complex and  
22  
23 sometimes fragmented nature of the language use. Understanding and accurately conveying  
24  
25 the meaning and intent of such language calls for specialised expertise that goes beyond  
26  
27 general language interpretation skills and beyond generic AMHP training. However, the  
28  
29 literature lacks comprehensive exploration of the specific competencies, training, and  
30  
31 qualifications that interpreters and AMHPs need to possess in order to jointly address  
32  
33 thought-disordered language within the context of MHAAs. By addressing this gap in the  
34  
35 literature, further research could expand on the practical implications of the MHA Code of  
36  
37 Practice provisions related to interpreter selection and utilisation with a focus on effective  
38  
39 collaborative practice.  
40  
41  
42  
43  
44  
45

46  
47 Whilst some of the AMHP related practice research focuses on power inequalities in MHAAs  
48  
49 (Buckland, 2020), this is only considered in monolingual contexts, which itself is not  
50  
51 acknowledged in the literature. The AMHP, as the primary decision-maker in the assessment,  
52  
53 is identified as holding a position of power. However, the circumstance of how the presence  
54  
55 of an interpreter introduces an additional layer of complexity to the assessment process,  
56  
57 influencing the distribution of power among the various participants involved, remains  
58  
59  
60

1  
2  
3 unaddressed. This is important because power is connected to the notion of ‘voice’,  
4  
5 understood to mean the expression of one’s wishes and feelings and that might have  
6  
7 influence. In the context of MHAAs, a crucial aspect of the AMHPs’ responsibility is to  
8  
9 distinctly discern, in adherence to legal mandates, the options aligned with the principle of  
10  
11 the 'least restrictive alternative' during the assessment process. Interpreter-mediation  
12  
13 introduces an additional layer of communication that either enables or constrains the service  
14  
15 user's voice and how it might be understood. Surprisingly, this crucial aspect has not been  
16  
17 comprehensively explored in the existing literature concerning one of the most profound civil  
18  
19 law powers, which allows the deprivation of an individual's liberty. Attention to the  
20  
21 availability and proficiency of interpreters and the challenges these pose for AMHPs is also  
22  
23 absent. This is salient because, in accordance with the MHA Code of Practice, AMHPs are  
24  
25 responsible for organising interpretation. AMHPs are also charged with engaging with an  
26  
27 assessed person’s Nearest Relative to ascertain whether they have an objection to the  
28  
29 person’s detention under the MHA. The available literature that discusses this role does not  
30  
31 mention any complexities that might arise if the AMHP and Nearest Relative or wider family  
32  
33 do not share a language (Dixon et al., 2019; Hemmington et al., 2021). However, previous  
34  
35 research on social work with interpreters has identified difficulties that social workers might  
36  
37 have in liaising with families of service users who use a language other than English, even  
38  
39 when interpreters are involved (Pollock, 2023). In sum, the way in which interpreting adds  
40  
41 further complexity to current practice concerns is largely absent from the current body of  
42  
43 knowledge.

## 6. Concluding remarks

This scoping review set out to answer two research questions about the state of knowledge concerning interpreter-mediated statutory mental health assessments, specifically MHAAs. The first question concerned the enablers and barriers to good practice including their international equivalents. The main finding of this review is the almost total absence of the consideration of interpreter-mediation in empirical research on MHAAs and the lack of evidence-based guidance for practice are the biggest barriers. Building on this idea, the absence of evidence highlights the potential catalysts for improving practice. This includes a focus on fostering collaborative interprofessional teamwork, which could involve joint training for AMHPs and interpreters. Additionally, exploring how and why the unique circumstances of statutory work within the mental health field may differ from conventional mental health interpreting practice is essential. Finally, it is crucial to examine how key considerations in AMHP practice, such as power dynamics and voice, can adapt to, or be influenced by, the additional layer of working with interpreters.

The second question for this review set out to explore how interpreter-mediation supports or impedes the legal rights and best interests of individuals assessed under the MHA or its international equivalents. Our principal finding is that none of the literature items we identified actually addressed this as an issue in its own right beyond guidance of when interpreters should be provided, and the rights of the individual to have access to high-quality interpretation. There is no direct evidence from practice and no clarity that evidence from related contexts, including mental health interpreting more generally, is adequately relevant to the very particular practice circumstances of MHAAs.

When considering the characteristics of the literature items identified, an unanticipated finding is the lack of transdisciplinary approaches across the fields of interpreting studies and

1  
2  
3 health/social care in this context. This literature review has brought together relevant  
4  
5 literature items from the fields of social work and interpreting studies that address  
6  
7 overlapping points in the context of MHAAs or equivalents. By synthesising the insights  
8  
9 from both disciplines, this review sought to highlight the interconnections and shared  
10  
11 perspectives that can contribute to a more comprehensive understanding of interpreter-  
12  
13 mediated MHAAs. The findings suggest that while both fields have valuable perspectives to  
14  
15 offer, both bodies of knowledge appear to operate separately. The lack of cross-fertilisation  
16  
17 hinders the development of a comprehensive understanding and approach to interpreter-  
18  
19 mediated MHAAs. This gap in interdisciplinary research likely points to limited opportunities  
20  
21 for interprofessional collaboration and training. Social workers and interpreters typically  
22  
23 work in separate organisational structures, with little opportunity for collaboration or joint  
24  
25 training. This can result in social workers and interpreters having limited knowledge of each  
26  
27 other's roles and responsibilities, leading to potential misunderstandings and challenges in  
28  
29 completing effective MHAAs or failing to conduct them in a suitable manner.  
30  
31  
32  
33

34  
35 This review is the first stage in a comprehensive research project on interpreter-mediated  
36  
37 MHAAs that will start to fill the gap in practice-based research we have identified and  
38  
39 provide highly specific guidance and training resources in this challenging field of practice  
40  
41 for both AMHPs and interpreters. It makes several important contributions to interpreting  
42  
43 studies: it draws timely attention to a highly specialised area of mental health interpreting; it  
44  
45 exemplifies the value of scoping reviews in cross-disciplinary studies on interpreting; it  
46  
47 addresses signed and spoken language interpreting in a single approach, and by focusing on a  
48  
49 single national context, it lays the foundations for a systematic approach to the topic in other  
50  
51 national contexts, thereby facilitating future cross-national comparisons.

**Title:** Interpreter mediation in statutory mental health assessments: a scoping review

**Key words:** Interpreter-mediated assessments, statutory mental health, involuntary treatment

For Peer Review

## Abstract

This interdisciplinary scoping review addresses the involvement of spoken and signed language interpreters in statutory mental health assessments. Specifically, this inquiry sought to identify and review pre-existing literature concerning the barriers to and facilitators ~~to~~ of effective practice in interpreter-mediated statutory mental health assessments, and the extent to which interpreter mediation supports or impedes a person's legal rights and best interests in this context. An interdisciplinary team applied the revised Joanna Briggs Institute scoping review framework to review forty-four items of empirical and grey literature covering relevant aspects of the available body of knowledge across the fields of social work, mental health and interpreting studies.

The review concludes that there is a lack of direct evidence on interpreting practice in the context of statutory mental health assessments, which is significant considering the high-stakes scenarios that may lead to the deprivation of liberty. The findings suggest that there is insufficient evidence regarding necessary modifications to standard interpreting practices for such assessments, as well as how assessors should adapt their own practice in response to the need for interpreting about how the involvement of interpreters in statutory mental health assessments requires adjustments to standard interpreting and monolingual assessment practice.

This work highlights the need for more focused research on good practices for interpreting within this context and calls for guidance to facilitate effective interprofessional collaboration between interpreters and other professionals engaged in these assessments for effective interprofessional working between interpreters and other professionals involved.

## 1. Introduction

This article concerns statutory mental health assessments potentially leading to involuntary detention in a psychiatric facility whether for further assessment and/or mental health treatment. In England and Wales, the statutory instrument governing this is the Mental Health Act 1983 (henceforth MHA), and similar legislation is present worldwide (Fistein et al., 2009). Specifically, the focus of this work is on understanding the practice of assessments in circumstances where an interpreter is required. We present the results of an international and interdisciplinary scoping review that sought to identify and examine pre-existing literature concerning the barriers ~~to~~ and facilitators ~~to~~ effective practice in interpreter-mediated statutory mental health assessments or Mental Health Act Assessments (henceforth MHAAs). We also explore the extent to which interpreter-mediation supports or impedes the legal rights and best interests of those being assessed within this context. It is important to note that statutory assessments related to mental capacity rather than mental illness fall outside the scope of this work.

## 2. Background

### 2.1 Topic and significance

MHAAs potentially leading to involuntary detention and treatment differ from those that might occur within a clinical diagnostic process or during ongoing treatment and therapy. In the latter scenarios, there is a growing body of existing literature in the field of interpreting and translation (e.g., Boyles and Talbot, 2017; Costa, 2022; Luk, 2008). MHAAs however usually occur in emergency or urgent circumstances where all parties are unlikely to have a pre-existing working relationship. In addition, the assessment process is explicitly bound by legislation, and is the most powerful civil practice whose powers can override, for instance, an individual's rights under Human Rights legislation. MHAAs require the co-operation of

1  
2  
3 several doctors and non-medical professionals at a time when an individual is experiencing a  
4 serious mental health episode that may even potentially pose a risk to themselves or others.

7 These are high stakes circumstances in which an individual's communication, language,  
8  
9 behaviour and understanding are likely to be altered and/or impaired because of their mental  
10  
11 state. As a result, the performance of interpreters, the collaboration of other professionals

12  
13 with them, and the impact of interpreter mediation on the outcomes for the individual

14  
15 undergoing assessment emerge as significant areas of concern. Consequently, , how other

16  
17 professionals work alongside them, and the effects of interpreter mediation on the outcomes

18  
19 for the person being assessed become a significant concern. This concern is the subject of the

20  
21 INForMHAA (Interpreters for Mental Health Act Assessments) (see Young et al., 2023), a

22  
23 project investigating professional practice and outcomes in interpreter-mediated assessments

24  
25 in the context of the MHA. The scoping review presented here serves as a precursor to this

26  
27 study. INForMHAA particularly focuses on the role of the how -Approved Mental Health

28  
29 Professionals (AMHP) jointly work with interpreters when conducting assessments under the

30  
31 MHA. Even though the role is open to mental health nurses, occupational therapists and

32  
33 psychologists, 95% of AMHPs are qualified social workers (as recognised in England and

34  
35 Wales), even though the AMHP role is also open to other allied professionals such a nurses,

36  
37 occupational therapists and psychologists (Skills for Care, 2024). Usually drawn from a

38  
39 social work background (Skills for Care, 2022), the AMHP role Their role is distinct from

40  
41 that of the (usually) two doctors responsible for undertaking a medical recommendation

42  
43 assessment. ing whether the individual has a mental health disorder. Instead Tthe AMHP is

44  
45 responsible for has the responsibility to undertaking an assessment based on all the

46  
47 circumstances gather necessary information from the including social person and including

48  
49 an assessed through an interview. in order to reach a decision about whether the person

50  
51 should be detained or not. TIn doing so, the AMHP must consider all the relevant factors

1  
2  
3 ~~surrounding the individual's context~~, including social and familial circumstances, in order to  
4 decide whether the person should be detained. ~~which then informs the outcome of the~~  
5 ~~assessment.~~  
6  
7  
8  
9

10 The AMHP role is predicated on effective interpersonal communication with the assessed  
11 person to discern their views and understanding of what is happening to them. For this  
12 reason, a specific clause was added in statutory guidance, requiring that the interview  
13 conducted as part of the assessment be carried out “in a suitable manner” (Section 13 (2)  
14 MHA, 1983). In fact, statutory guidance that accompanies the MHA explicitly highlights the  
15 need to ensure appropriate communication for groups who might have difficulties in  
16 communicating effectively (Department of Health, 2015, paragraphs 4.4, p. 36). The  
17 guidance explicitly recognises that factors hindering effective communication include  
18 language differences, challenges comprehending technical terminology or sustaining  
19 attention, hearing or visual impairments, difficulties in literacy or numeracy, learning  
20 disabilities, as well as cultural differences (ibid.). ~~In the case of language differences, the~~  
21 guidance states that “every effort should be made to identify an interpreter who is appropriate  
22 to the patient” (ibid). ~~with delegated responsibility to source and provide spoken/signed~~  
23 ~~language interpreters where required.~~ This provision was originally inserted to safeguard the  
24 rights of individuals whose first language may not be English and to prevent the possibility of  
25 unlawful detention based on ineffective communication (Jones, 1991, p.48). ~~Such factors~~  
26 ~~might include physical/sensory impairments, cognitive disabilities, or a language difference.~~  
27  
28 Despite this emphasis on meeting communication needs, there is no requirement to  
29 systematically report the language used in a MHAA, in contrast to the recording of gender  
30 and ethnicity. Additionally, there is no evidence gathered as part of the UK minimum data set  
31 used to analyse the outcomes of MHAAs (NHS Digital, 2022b) indicating whether an  
32 interpreter was involved in an assessment. At the moment, there is uncertainty about how the  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47

55  
56  
57  
58  
59  
60

1  
2  
3 presence of an interpreter affects the process and outcome of MHAAs ~~Mental Health Act~~  
4 assessments. This uncertainty is particularly concerning given that “those from ethnic  
5  
6 minority communities are far more likely to be subject to compulsory powers under the Act,  
7  
8 whether in hospital or in the community” (Department of Health and Social Care,  
9  
10 2018). Consequently, the impact of interpreter-mediated MHAAs is unknown, which is  
11  
12 particularly concerning given the current data on differential rates of detentions under the  
13  
14 MHA according to ethnicity and cultural heritage (Barnett, 2019). While the majority of  
15  
16 individuals from diverse ethnic backgrounds would not necessarily utilise languages other  
17  
18 than English in a MHAA, it is important to acknowledge that there are some who may,  
19  
20 particularly among new arrivals as well as refugees and asylum seekers (Migration  
21  
22 Observatory, 2019). According to the Office of National Statistics (ONS, 2022) census data  
23  
24 for England and Wales, 8.9% (5.1 million people) did not report English as their main  
25  
26 language. Within this group, 43.9% (2.3 million) could speak English very well, 35.8% (1.8  
27  
28 million) could speak English well, 17.1% (880,000) could not speak English well, and 3.1%  
29  
30 (161,000) could not speak English at all. Given that in 2020-2021, Furthermore, in 2020-  
31  
32 2021, there were over 53,000 detentions under the MHA in England and Wales (Statista,  
33  
34 2023). Given the and considering the diverse language abilities within this population, it  
35  
36 seems reasonable to assume that a number of MHAAs may require the assistance of an  
37  
38 interpreter.  
39  
40  
41  
42  
43  
44  
45

46  
47 In MHAAs, as is the case in other forms of psychological assessments, effective  
48  
49 communication serves as a key tool for gaining insights into the individual’s mental state,  
50  
51 identifying potential underlying factors contributing to their distress and symptoms, and  
52  
53 interpreting the significance of their behaviour (Weber et al., 2022). This involves actively  
54  
55 considering the language used by the individual and how it may be affected by, or linked to,  
56  
57 the individual’s mental health condition (Cambridge et al., 2012). Moreover, fostering an  
58  
59  
60

1  
2  
3 effective relational understanding between the assessor and the person being assessed is also  
4 crucial for comprehending the individual's mental health and well-being (Rodríguez-Vicente,  
5 2021). This not only facilitates a meaningful assessment but also ensures that the person feels  
6 heard, understood, and supported throughout the evaluation process. ~~Consequently, this,~~  
7 ~~which ultimately~~ contributes to more effective communication, a key factor in achieving  
8 equitable outcomes (Tribe & Thompson, 2022). Studies outside of the specific context of  
9 MHAAs have demonstrated that failure to communicate in a language other than a person's  
10 primary, or preferred, language, ~~as failure to do so~~ may result in an incomplete or distorted  
11 evaluation of their mental state (Casas et al., 2012). Additionally, the extensive body of  
12 literature on interpreter-mediated encounters in various health and social care settings  
13 suggests that the effectiveness of such interactions significantly relies on the quality of  
14 collaborative working dynamics ~~between providers and interpreters in facilitating effective~~  
15 ~~communication between the provider and the interpreter~~ (Geiling et al., 2021). ~~However,~~  
16 ~~while collaborative working dynamics are advocated as a fundamental principle, their~~  
17 ~~interpretation may vary based on the unique needs and characteristics of each setting. While~~  
18 ~~this collaborative working dynamic is an aspirational overarching principle, its interpretation~~  
19 ~~may vary depending on the unique needs and characteristics of each setting~~ (Hsieh et al.,  
20 2013).

## 2.2 Approach: why a scoping review?

21  
22 In seeking to assemble and review existing evidence concerning interpreter-mediated  
23 MHAAs as a precursor to the wider INforMHAA study, there were three considerations.  
24 Firstly, the topic constitutes a specialised field within the broader discipline of ~~interpreting~~  
25 ~~studies, public service interpreting~~ distinct from more established domains of mental health  
26 interpreting, such as psychological therapy. Nonetheless, some of the literature concerning  
27 interpreter practice in mental health assessments more generally may be of relevance even if  
28  
29  
30  
31  
32  
33  
34  
35  
36

54  
55  
56  
57  
58  
59  
60

1  
2  
3 not formally linked to this specific context. Thus, the boundaries of the field under study and  
4  
5 review are not strictly clear-cut. Secondly, practice knowledge may not be confined solely to  
6  
7 formal literatures, with empirical studies ~~of~~on this specific topic likely to be rare;  
8  
9 consequently, a broad and inclusive approach was deemed necessary to identify and consider  
10  
11 a potentially fragmented body of work. Thirdly, the study for which the ~~intended~~ review was  
12  
13 a precursor was firmly associated with practice under one specific legislation, the MHA, and  
14  
15 in one geographical context (England and Wales). Yet, valuable insights, evidence sources,  
16  
17 and potentially best practices were anticipated from an international context where similar  
18  
19 legislation and practices exist. Considering these factors, a scoping review approach was  
20  
21 selected to address the questions outlined in the following section.  
22  
23  
24  
25

26  
27 Scoping reviews have gained increasing prominence as a robust evidence-based methodology  
28  
29 within various literature domains, particularly in the fields of medicine, healthcare, and social  
30  
31 work/social care practice (Bradbury-Jones et al., 2022). They find their most valuable  
32  
33 application in situations where the existing research literature is limited, rendering systematic  
34  
35 reviews less insightful, and where professional practice knowledge exists but may be more  
36  
37 commonly found outside of the empirically driven literatures (Grant and Booth, 2009). The  
38  
39 approach adopted in scoping reviews stands in contrast to systematic reviewing and meta-  
40  
41 analyses, which primarily focus on assessing the quality and depth of existing research  
42  
43 evidence, as illustrated in the interpreting field in the work of Brisset et al. (2013),  
44  
45 Krystallidou et al. (2020) and Theys et al. (2020). By contrast, the essence of a scoping  
46  
47 review lies in collating the breadth of available knowledge, which often extends into grey and  
48  
49 informal literature, typically addressing questions of professional uncertainty (Arskey and  
50  
51 O'Malley, 2005). Considering all these factors, the incorporation of a scoping review into the  
52  
53 field of interpreting studies is anticipated to make a contribution by mapping information  
54  
55  
56  
57  
58  
59  
60

from diverse sources across various domains pertaining to the under-researched area of statutory mental health assessments.

### 3. Method

The review method followed the revised Joanna Briggs Institute scoping review framework (Peters et al., 2020) consisting of title and review questions; inclusion criteria; definition of participants/concept/context; search strategy; evidence screening and selection; data extraction (including charting); data analysis (synthesis); presentation of results; and conclusions. This framework is expanded from Arksey and O'Malley (2005) and Levac et al. (2010) and is reported in accordance with the PRISMA-ScR guidelines (Tricco et al., 2018). The protocol for the scoping review has been pre-registered on the international platform INPLASY, with the reference number: INPLASY20220086.

#### 3.1 Defining the research questions

The PICo approach (Population Interest Context) (Richardson et al., 1995) guided the formulation of the research questions.

**Table 1:** PICo process for formulation of research questions

<b>P: Population of interest</b>	<ul style="list-style-type: none"> <li>• Those who are assessed under the MHA or internationally equivalent legislation</li> <li>• Mental health professionals involved in the assessment with specific reference to AMHPs (and similar roles internationally)</li> <li>• Spoken and/or signed language interpreters involved in such assessment.</li> </ul>
<b>I: Interest</b>	<ul style="list-style-type: none"> <li>• Evidence concerning the type and quality of interprofessional working and its impact on both the process and outcome of formal assessments under the Mental Health Act 1983 and international equivalents.</li> </ul>

	<ul style="list-style-type: none"> <li>• Guidance for interpreter-mediated MHAAs and their international equivalents</li> </ul>
<b>Co: Context</b>	<ul style="list-style-type: none"> <li>• Statutory assessment under the MHA or its international equivalents</li> <li>• The actual practice of the assessment when AMHPs (and international equivalents) and interpreters are required to work together, and the person being assessed <del>is not a user of the primary language in which the assessment is conducted.</del> <u>does not speak the primary language used for the assessment.</u></li> </ul>

In the specified context of interest, namely the professional practice ~~between~~ involving AMHPs (and their international equivalents) and interpreters within the non-medical interview, components of the MHA assessment (and its international equivalents), the guiding research questions of the scoping review are:

1. What are the enablers and barriers to good practice in interpreter-mediated MHA (1983) assessments (and their international equivalents)?
2. To what extent and how might interpreter mediation support or impede the legal rights and best interests of those assessed under the MHA (1983) (or its international equivalents)?

### *3.2 Definition of terms for the purposes of scoping review*

To conduct the scoping review effectively, it was necessary to establish clear definitions for the key terms used in literature search. The term "Mental Health Act (1983)" refers to the formal legislation in England and Wales governing the compulsory assessment, treatment, and potential detention of individuals experiencing mental illness, either for their own safety or for the protection of others.

1  
2  
3 It is worth noting that mental health legislation in England and Wales the UK undergoes  
4 periodic review, as demonstrated by the release of a draft Mental Health Bill in June 2022  
5 (HC/HL, 2023), outlining proposed reforms to the existing Mental Health Act.  
6  
7 Subsequent However, none of the recommendations made by the Joint Consultative  
8 Committee y, the government the government has responded to the recommendations put  
9 forth by the committee have been accepted by the current Government (DHSC 2024). As of  
10 the time of writing this article, no new legislation has been enacted and any reform remains in  
11 obeiance-

12  
13  
14

58  
59  
60  
“International equivalents” refer to parallel pieces of legislation for the same purpose and with the same or similar powers that exist in other countries, although the exact details of the provisions contained within them may not be identical (Fistein et al., 2009).

“Translation” is understood in this study as a superordinate term used to refer to the process of transferring meaning from one language into another (Baker, 2011). In this paper, we refer to interpreting as a form of translation in which the source-language text is presented only once and thus cannot be reviewed or replayed, and the target-language text is produced under time pressure, with little chance for correction or revision (Pöchhacker, 2004, p.10: citing Otto Kade); and this definition applies for working between spoken and signed texts. This differs from how translation is typically perceived as a text-based event which does not occur in real time and is potentially correctable as it can be edited and polished until a final product is presented (Leneham, 2005). Despite this distinction in the translation and interpreting literature, the word ‘translator’ is commonly and incorrectly used in the field of health and social care to refer to interpreters working in live mediated events, so we have considered the use of both terms in this review. Additionally, in this review we focus on the work of

professional interpreters, which excludes interpreting activities performed by bilinguals who have had no formal training, may interpret or broker on an ad hoc basis, and/or are not remunerated for their work as interpreters (Napier, 2021). In this paper we understand “translation” as a superordinate term, which refers to written, spoken and signed processes of meaning transfer. However, we acknowledge the common misuse of the term in the field of health and social care to refer solely to interpreters working in live mediated events, which is why the terms translation and interpreting were included in the review.

Additionally, in this review we focus on the work of professional “interpreters”, which excludes interpreting activities performed by bilinguals who have had no formal training, may interpret or broker on an ad hoc basis, and/or are not remunerated for their work as interpreters (Napier, 2021).

### 3.3 Search criteria

For inclusion / exclusion criteria applied to the initial search of the literature see Table 2.

**Table 2:** Search inclusion and exclusion criteria

Variable	Inclusion Criteria	Exclusion Criteria
<b>Date range</b>	1 <sup>st</sup> January 1980 – 31 <sup>st</sup> March 2022	Literature published before 1980 refers to the preceding MHA of 1959 and likely to catch former legislations elsewhere that are no longer current.
<b>Design/study type</b>	All <u>possible study designs and types for academic papers</u> including: literature reviews, peer reviewed quantitative, qualitative and mixed method studies	None
<b>Sources</b>	<ul style="list-style-type: none"> <li>• <u>Peer reviewed journal articles.</u></li> <li>• <u>Pre-prints.</u></li> </ul>	Literature produced by lobbying organisations and groups. Social media posts.

Variable	Inclusion Criteria	Exclusion Criteria
	<ul style="list-style-type: none"> <li>• <u>1</u> Book chapters.</li> <li>• <u>1</u> Grey literature including working papers, statutory guidance, legislation, professional guidance, regulatory/governmental reports.</li> <li>• <u>1</u> Student doctoral theses.</li> </ul>	
<b>Language</b>	Publications in: <ul style="list-style-type: none"> <li>• <u>1</u> -English</li> <li>• <u>1</u> , French</li> <li>• <u>1</u> , Spanish</li> <li>• <u>1</u> , German</li> <li>• <u>1</u> , Dutch</li> <li>• <u>1</u> , British Sign Language (BSL)</li> <li>• <u>1</u> , American Sign Language (ASL)</li> <li>• <u>1</u> and International Sign.</li> </ul> [The languages of the study team]	Those outside of the inclusion criteria.
<b>Location</b>	Pertaining to any country and research carried out in any international location.	None
<b>Focus of Study</b>	<ul style="list-style-type: none"> <li>• <u>1</u> <del>1</del> The MHA in England and Wales and/or its national or international equivalents AND interpreting and translation within such assessments.</li> </ul>	<ul style="list-style-type: none"> <li>• <u>1</u> <del>1</del> General literatures on interpreting and translation in mental health that are not of relevance to statutory contexts.</li> <li>• <u>2</u> <del>2</del> General research concerning the professional</li> </ul>

Variable	Inclusion Criteria	Exclusion Criteria
	<ul style="list-style-type: none"> <li>• <del>2</del>. The role of AMHPs in these contexts in relation to practice and outcomes particularly with respect to working with interpreters.</li> <li>• <del>3</del>. Other language concordant professionals and roles including cultural advocates in MHAAs and their international equivalents.</li> <li>• <del>4</del>. Signed and/ or spoken language interpreting.</li> </ul>	<p>practice in MHAAs and their international equivalents that does not concern interpreting and translation.</p> <ul style="list-style-type: none"> <li>• <del>3</del>. Literature focussing on family members associated with MHAAs and their international equivalents.</li> <li>• <del>4</del>. Work focussing on discourse analyses</li> <li>• <del>5</del>. Items focused primarily on the linguistic aspects of interpreting and translation</li> </ul>
<b>Service user group</b>	Adults assessed under the MHA and its international equivalents who are assessed in circumstances where an interpreter is required.	<ol style="list-style-type: none"> <li>1. Work concerning children and young people covered by this legislation.</li> <li>2. Patients undergoing statutory assessments that involve potential deprivation of liberty conditions but which are not covered by the MHA or international equivalents.</li> </ol>
<b>Workforce Roles</b>	<ol style="list-style-type: none"> <li>1. AMHPs working within the MHA and their international equivalents.</li> <li>2. Professional interpreter of a spoken or signed language</li> </ol>	<ol style="list-style-type: none"> <li>1. Family members or friends acting as interpreters</li> <li>2. Translators who do not carry out interpreting</li> </ol>

### 3.4 Search terms and strategy

We entered keyword synonyms using data base thesauri (MeSH entry terms in PubMed) and search terms with database-appropriate syntax, parentheses, Boolean operators AND/OR for search strings, and field codes were specified. We also incorporated equivalents of these terms in the languages specified in our inclusion criteria. The key concepts and synonyms are listed in Table 3; search terms and the Boolean operators used in Table 4.

**Table 3:** Concepts and descriptors

<b>Statutory Mental Health</b>	<b>Interpreter Mediation</b>
AMHPs	Interpreters
Mental health assessment	Translation
Mental health law	Language Barriers
Compulsory detention	Translators
Sectioning	Co-working

The data bases searched were: PubMed, ASSIA (Applied Social Sciences Index and Abstracts) PsycINFO (American Psychological Association), Web of Science (Clarivate), CINAHL (Cumulative Index to Nursing and Allied Health Literature), Social Care Online, and EThOS. Additionally, we searched the online indices of ~~twenty six~~ twenty-six specific journals where publications on this topic were likely to be placed across the disciplines of

1  
2  
3 social work, allied health professions, translation and interpreting and sign language/deaf  
4 studies as well as subject-specific publisher websites using key terms so we could capture  
5  
6 book chapters (see Appendix 1 in Supplemental Material alongside this article for a full list).  
7  
8 A targeted search focused on grey literature was largely based on the research team's own  
9  
10 professional knowledge encompassing NHS Digital, NHS England, the Care Quality  
11  
12 Commission, legislation and statutory guidance in mental health, professional resources and  
13  
14 publications for public sector spoken language interpreters and for signed language  
15  
16 interpreters.  
17  
18  
19  
20  
21

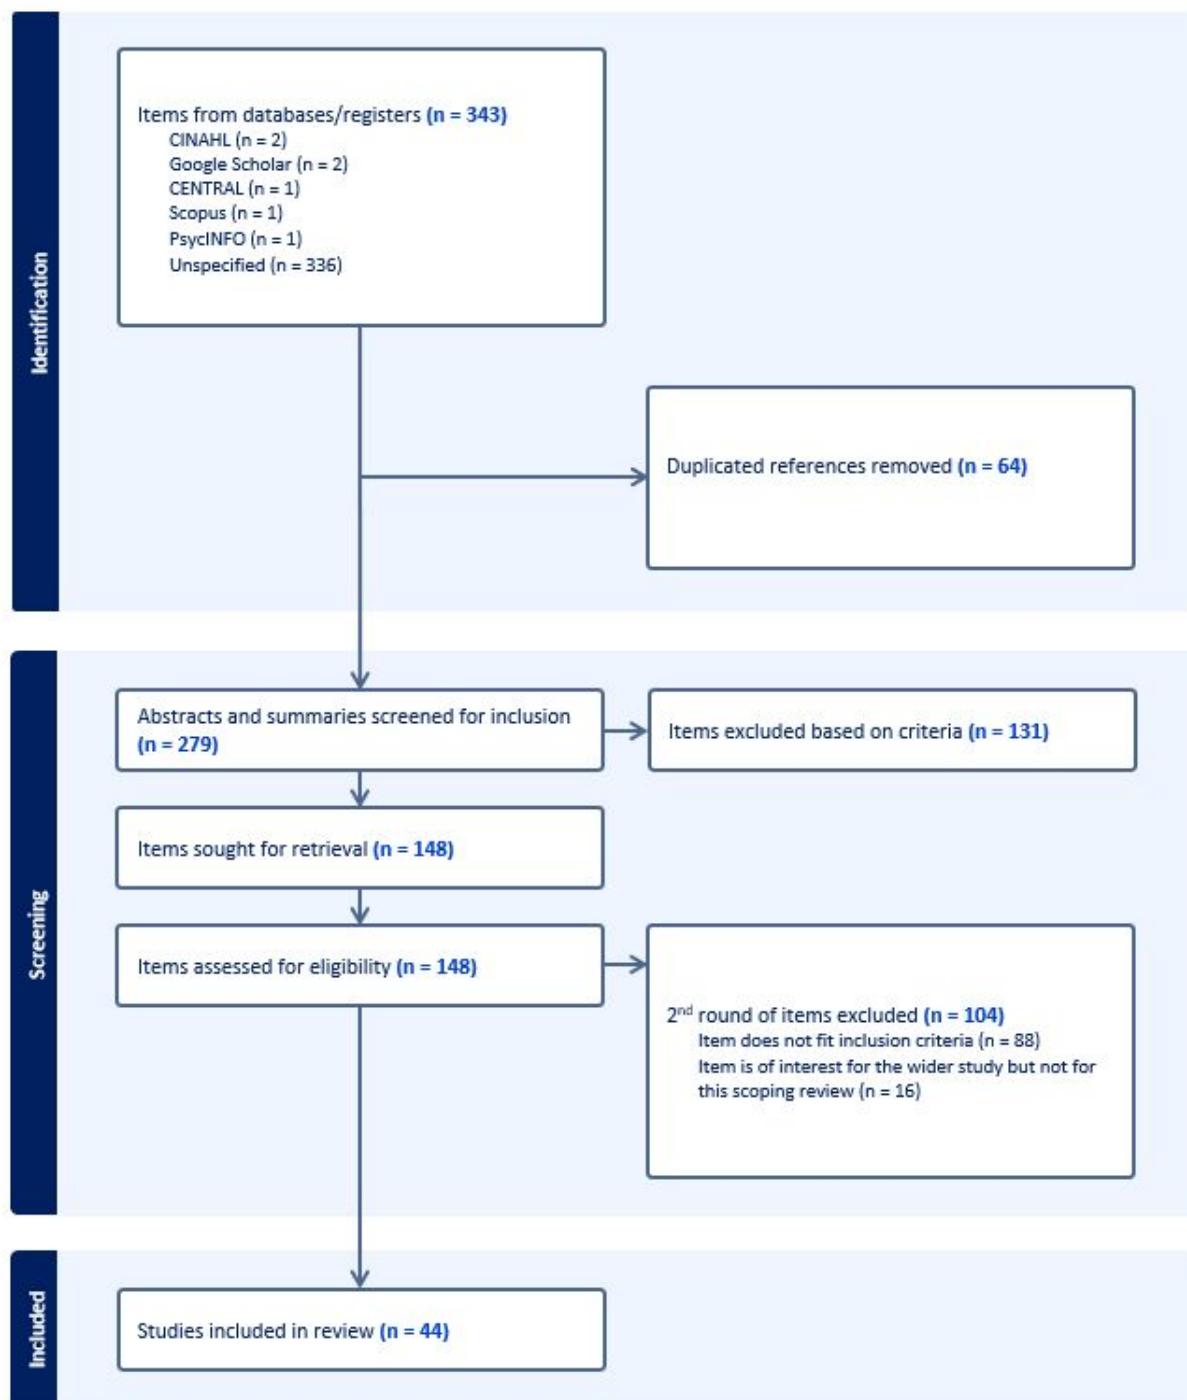

### 22 *3.5 Identification and selection of relevant studies*

23  
24 The online systematic reviews software Covidence was used to assist with the importing and  
25  
26 screening of citations. Selection followed a two-stage process: (i) title and abstract screening  
27  
28 was carried out by three reviewers (AY, JN, SV). Any item classified 'maybe', or where a  
29  
30 conflict of opinion between the reviewers occurred, was subjected to a discussion to reach a  
31  
32 consensus of yes or no; (ii) full text screening, by reviewers (AY, RT) with a third (NRV)  
33  
34 acting as an independent reviewer to resolve any items classified as 'maybe' or where  
35  
36 conflict required further discussion to reach consensus. Screening at both stages required the  
37  
38 involvement of a team member with expertise in interpreting and another member with a  
39  
40 background in ~~mental health~~-social work in the context of mental health. This professional as  
41  
42 well as academic judgement was crucial in ensuring that literature ~~was selected of~~  
43  
44 ~~relevance~~the literature selected was relevant to the questions guiding the review even if not  
45  
46 directly addressing statutory mental health assessment. It also allowed for the inclusion of  
47  
48 work that was addressing the statutory context from the perspective of mental health  
49  
50 professionals where interpreting/translation was highly pertinent ~~but totally absent from the~~  
51  
52 ~~approach within the work~~but may have been overlooked. The emphasis on identifying  
53  
54 "silences" within existing research was crucial when selecting studies. A scoping review,  
55  
56  
57  
58  
59  
60

1  
2  
3 aimed at mapping out areas with limited pre-existing work, offers the flexibility to adopt this  
4 approach, which may not be feasible in a systematic review. ~~A scoping review that seeks to~~  
5 ~~map out a territory where there is little pre-existing work has the flexibility to take this~~  
6 ~~approach in a way that a systematic review would not.~~  
7  
8  
9  
10  
11  
12

13 Reasons for exclusion at either stage of study selection were recorded. After duplicates were  
14 removed, 279 items were identified at stage one screening. 131 were excluded and 148  
15 progressed to full text screening. 104 studies were excluded at this point leaving 44 items  
16 which were retained for review (Figure 1).  
17  
18

### 3.6 Charting and tabulation

A bespoke charting template was created in Microsoft Excel combining elements of the charting template available in Covidence, which is more suitable for intervention studies, and

1  
2  
3 one available through the Joanna Briggs Institute (Evans et al., 2019), which encompasses a  
4 wider range of study designs and types of literature. The study characteristics charted  
5 included: (a) authors, year of publication; (b) category of publication: empirical study,  
6 literature review, grey literature, book chapters/book; (c) country ~~the work relates to of~~  
7 relevance; (d) key findings or main patterns relevant to the review. These categories are  
8 reflected in Table 5 below.  
9

## 17 4. Results

### 20 4.1 Characteristics of included items

23 Results of the charting phase are presented in Table 5 below. This includes a statement about  
24 whether issues of language/communication/interpreting were explicitly included within the  
25 article's focus ~~explicitly~~ given the relevance of the topic addressed.  
26  
27

#### 30 4.1.1 Type of literature

33 Of the forty-four items reviewed in the final stage, twenty-four are grey literature items, ten  
34 are empirical studies, six are literature reviews, and four are classified as 'other'.  
35

38 Amongst the grey literature items, three sub-groups can be differentiated. The first sub-group  
39 consists of fifteen items, which are publications by government and statutory bodies (such as  
40 the Care Quality Commission). The second sub-group consists of seven professional  
41 guidelines documents, with five targeting mental health professionals and two targeting  
42 interpreters. The third sub-group consists of two online reports on legal matters by experts in  
43 the matter.  
44  
45

48 Out of the ten items featuring empirical data, seven concern aspects of AMHP professional  
49 practice, and three concern interpreters working in mental health contexts. Among these  
50 empirical items: one is quantitative in design, one is a retrospective study of patient visits,  
51 two are mixed methods, combining surveys, interviews, and focus groups. The remaining six  
52  
53  
54  
55  
56  
57  
58  
59  
60

empirical studies follow a qualitative methodology involving interviews with sample sizes ranging from ten to thirty-three participants.

Out of the six literature reviews: two are narrative reviews, two are scoping reviews, and two are systematic reviews. Regarding their thematic scope, two of the reviews concern AMHP practice, and three reviews are about the involvement of interpreters in mental health in general and the impact of language mediation on the quality of care in statutory mental health. Finally, one review concerns ethnic variations in compulsory detention under the MHA.

#### 4.1.2 Items by country

Among the ten empirical items, seven were generated by UK-based universities, one in Ireland, one in the US, and one in South Africa. Regarding the six literature reviews, two had a UK focus, two had a US focus, and two had an international focus. For the seven professional guidelines, four originated in the UK, and three in Australia. The remaining grey literature items, comprising government and statutory bodies' reports, have a UK focus. No items in languages other than English were retrieved.

**Table 5: Characteristics of selected items**

Author	Country	Title	Category	Focus	Findings
#214 <sup>1</sup> O'Hare et al. (2013)	UK	Implementing mental health law: A comparison of social work practice across three jurisdictions	Empirical: Qualitative exploratory using vignettes. 28 participants	The social worker role in implementing mental health law.	Variations in legal and policy frameworks created differing viewpoints among mental health social workers on the implementation of laws in their respective jurisdictions, particularly around risk assessments and intervention. No mention of participants' experience with linguistically and

<sup>1</sup> Numbers following a hashtag reference the original number label in the review software 'Covidence', used to support this review.

					culturally diverse people.
#57 Watson (2016)	England and Wales	Becoming an Approved Mental Health Professional: An analysis of the factors that influence individuals to become Approved Mental Health Professionals	Empirical: 12 qualitative semi structured interviews	The personal, professional, and social factors that influence individuals to become AMHPs.	Career advancement and professional growth, exercising independent judgement and job security, are essential considerations. No mention of language/culture issues.
#212 Davidson et al. (2021)	Northern Ireland	Mental health law assessments: Interagency cooperation and practice complexities	Empirical: Audit. 189 assessments	Routine practice and identification of outstanding issues as a basis for policy and guidance development.	Coordinating professionals, resource pressures, interprofessional collaboration. Language/culture/ethnicity not a concern in policy guidance.
#13 Dixon et al. (2019)	England and Wales	Treading a tightrope: Professional perspectives on balancing the rights of patients and relatives under the MHA in England	Empirical: Questionnaires and focus groups. 55 participants	AMHP interpretations of their legal responsibilities towards the Nearest Relative.	Balancing the rights of people assessed and the Nearest Relative was challenging. No discussion of potential language differences.
#205 Abbott (2021)	England and Wales	A study exploring how social work AMHPs experience assessment under Mental Health Law: Implications for Human Rights-oriented social work practice	Empirical: 11 qualitative interviews.	Experiences of AMHPs in conducting MHAAs and implications of these experiences for human rights-oriented social work practice.	AMHPs face difficulties when attempting to reconcile legal frameworks with a human rights-based approach. Language differences not considered in ethical challenges around the person's <i>voice</i> being diminished during the process of assessment.
#7 Hemmington et al. (2021)	England and Wales	Approved Mental Health Professionals, best interests assessors and people with lived experience: An exploration of professional identities and practice	Empirical: Mixed methods 258 AMHPs, 248 BIA assessors. 18 service users/relatives/carers	The professional identity and practice of AMHPs and Best Interests Assessors in relation to people with lived experience of mental health issues.	Highlights the importance of effective communication and collaboration between mental health professionals and people assessed/Nearest Relative. Does not mention potential relevancy of

Author	Country	Title	Category	Focus	Findings
					language/cultural differences.
#145 Zimányi (2013)	Ireland	Somebody has to be in charge of the session. On the control of communication in interpreter-mediated encounters	Empirical: Semi structured qualitative interviews. 11 MH workers 12 Interpreters	The power held by MH professionals and interpreters as illustrated by patterns in communication control behaviours.	Control dynamics between interpreters and MH professionals identified but not in relation to statutory contexts.
#119 Flynn (2013)	USA	Primary care utilization and mental health diagnoses among adult patients requiring interpreters	Empirical: Retrospective secondary data analysis. Adult outpatients (n=63,525)	Utilization patterns of healthcare services and prevalence of mental health diagnoses among adult patients who require interpreters compared to those who do not require interpreters.	Patients needing interpreters had a higher mean number of hospital visits overall, a lower frequency of mental health diagnoses but higher frequency of diagnoses recognised as potential <i>somatic</i> symptoms. No data on statutory MH assessments.
#133 Drennan and Swartz (2002)	South Africa	The paradoxical use of interpreting in psychiatry	Empirical: Ethnographic exploration	The role and influence of interpreters on psychiatric diagnosis and institutional management of patients with other languages.	When no shared language with the clinician: (i) a greater tendency to view the patient as exhibiting cognitive impairment or thought disorder (ii) psychiatrists often used the interpreter's opinion of the patient as a form of clinical assessment. No discussion of involuntary admission.
#11 Simpson (2020)	England and Wales	A structured narrative literature review of Approved Mental Health Professional detention decisions: An infusion of morality	Literature review: Narrative	Review of detention decisions by AMHPs	This review highlights risk, accountability, and morality and sub-themes of emotions, intuition, uncertainty, coercion, and alternatives (to hospitalisation). No reference to language/culture/ethnicity.
#12 Buckland (2020)	England and Wales	Power as perceived in MHA assessment contexts: A	Literature review: Scoping	Participants in MHAAs (assessing team, service users and carers) and	MHAAs are frequently characterised by inequality among participants, despite a

Author	Country	Title	Category	Focus	Findings
		scoping review of the literature		power relationships.	policy emphasis on collaboration and recovery. Power inequalities in language/culture/ethnicity not discussed.
#229 Flores (2005)	United States	The impact of medical interpreter services on the quality of health care: A systematic review	Literature review: Systematic	The impact of interpreter services on quality of care.	Health care quality is compromised when untrained interpreters in medical encounters with LACD patients, with serious consequences for patients with mental disorders. No discussion of statutory MH assessment.
#42 Fennig and Denov (2001)	International	Interpreters working in mental health settings with refugees: An interdisciplinary scoping review	Literature review: Scoping	Peer-review of 84 studies on interpreters working in MH settings with refugees.	Interpreter provision in MH contexts has a positive impact on refugee clients' quality of care and clinical outcomes. No mention of statutory MH assessments.
#249 Searight and Russell (2013)	United States	Foreign language interpreters in mental health: A literature review and research agenda	Literature review: Narrative	Interpreters in MH settings.	Most of the literature focuses on providing clinical guidelines for interpreters. Discussion of impact of interpreter mediation in accuracy of psychiatric diagnosis but no reference to statutory MH assessments.
#21 Barnett et al. (2019)	International	Ethnic variations – mental health compulsory detention	Literature review: Systematic	Incidence of involuntary detention among BAME and migrant communities in the UK and other parts of the world.	BAME and migrant communities face a higher likelihood of being subjected to psychiatric detention although risk varies among different ethnic groups. This work only focuses on ethnicity and does not address any potential impact of language differences or interpreter utilisation on detention rates. Minor mention of language barriers as a potential explanatory factor for disparities in detention.
#18	UK	Working with interpreters	Other: Commentary	Challenges and opportunities	Highlights hospital managers have a

Author	Country	Title	Category	Focus	Findings
Tribe and Lane (2009)		across language and culture in mental health		involved in working with interpreters in MH.	statutory duty to provide information to patients and Nearest Relative about detention, consent to treatment, rights of appeal and other legal matters thus providing interpreters if necessary.
#33 Bot (2015)	The Netherlands	Interpreting in mental health care	Other: Book chapter	Interpreters' role and involvement in MH encounters, and joint working dynamics between MH professionals and interpreters.	Interpreters move across a continuum of interaction in psychological therapies and communication with psychotic patients. No mention of statutory MH assessments.
#2 Carney (2021)	England and Wales	MHA assessment, sectioning, Tribunals and Lay Managers' Hearings	Other: Book chapter	Practical guidelines for professionals working with deaf or hard of hearing people in a set of statutory MH settings including MHAAs	In case of language discordancy with a deaf person, the MH professional must work with a registered/experienced interpreter and with a relay interpreter in the case of language dysfluency. Interpreters need to be supported in their preparation. Online interpreters are crucial in assessments where an in-person interpreter might not be provided on time. Good communication must also be provided following the MHAA in the admission process, also the Nearest Relative must be consulted by an AMHP in all cases if practicable.
#193 Wand et al. (2020)	New South Wales, Australia	Working with interpreters in the psychiatric assessment of older adults from culturally and linguistically diverse backgrounds	Other: Commentary	The dynamics involved in working with interpreters in MH assessments of older adults.	Professional interpreters have distinct advantages over ad hoc interpreters in the psychiatric assessment of older adults requiring language mediation, but patients highly value the broader

Author	Country	Title	Category	Focus	Findings
					roles that family members may take when acting as interpreters. No mention to how this applies to statutory assessment contexts. .
#155 Miletic et al. (2006)	Australia	Guidelines for working effectively with interpreters in mental health settings	Grey <u>literature</u> : <u>professional guidelines?</u>	Instructions/suggestions for MH professionals working with interpreters.	Australian MHA states staff must ensure client rights are conveyed through interpreters in a MH environment. These guidelines recognise legal obligations under the MHA (Australia) may take precedence over other factors such as the wishes of the assessed person.
#8 ASLI (2020)	UK	Guidelines for Booking Interpreters in Healthcare Settings during the COVID-19 Pandemic	Grey <u>literature</u> : <u>professional guidelines</u>	Guidelines for HC professionals when working with deaf patients and sign language interpreters during the COVID pandemic.	Within MHC, mention of the special needs of deaf sign language users assessed under the MHA and warns of the potential legal consequences of an incorrect assessment.
#158 Bevan (2018)	UK	Best practice guide for mental health practitioners working with BSL/English interpreters	Grey <u>literature</u> : <u>professional guidelines</u>	Guidelines for MH professionals working with interpreters with the BSL-English	Specific mention made of AMHPs and MHAAs stating that the AMHP must arrange for the booking of an interpreter who is qualified and registered with a governing body with expertise in MH. Special mention made of thought-disordered language requiring particular expertise.
#156 Wilson et al. (2017)	Scotland	2018 Revision of the Mental Welfare Commission for Scotland - Good practice guide: Working with an interpreter	Grey <u>literature</u> : <u>professional guidelines</u>	Guidelines for people involved in interpreter-mediated MH settings	Recognises the need for interpreters and interviewers to work as a team to achieve best outcomes, need to adapt to each context including MH Tribunals.

Author	Country	Title	Category	Focus	Findings
#328 Gloucestershire county council (2020)	England	Gloucestershire HSC trust – AMHP reporting guidelines	Grey <u>literature</u> : <u>professional guidelines</u>	Document for AMHPs to provide the record of an MHA assessment.	Option to record language ‘normally used’ along with ‘ethnic origin’ and ‘culture’.
#178 Hlavac (2017)	Australia	Mental health interpreting guidelines for interpreters	Grey <u>literature</u> : <u>professional guidelines</u>	Guidelines for interpreters to work optimally in MH interactions.	Definitions of MH terms, protocols, ethical considerations in MH, and list of patients’ rights and legal terms, medico-legal MH tribunals and MH legislation in Australian states, involuntary treatment orders, protection or rights.
#164 ASLIA (2011)	Australia	ASLIA Guidelines for interpreting in mental health settings	Grey <u>literature</u> : <u>professional guidelines</u>	Reframes the ASLIA interpreters’ code of ethics to the specifics of working in mental health settings.	It provides a discussion of how regular interpreting practice ethical principles may develop in MH practice, mentions the need for an interpreter to have a pre-chat (briefing) with the clinician to ascertain the purpose of the session, e.g. involuntary treatment order. No specific discussion of best practice.
#331 NHS England (2020)	England and Wales	Legal guidance for mental health, learning disability and autism, and specialised commissioning services supporting people of all ages during the coronavirus pandemic	Grey <u>literature</u> : <u>legal guidance</u>	Guidelines in fulfilling statutory roles and responsibilities during the pandemic in England and Wales as part of the Coronavirus Act 2020.	This guidance, since expired, approved the lawful use of remote assessments during the coronavirus pandemic in some special circumstances. The focus on ‘very limited circumstances’ suggests that a remote assessment might be deemed unlawful and makes no mention of using (or not) interpreters remotely.
#338 Devon Partnership NHS Trust v Secretary of	England and Wales	England and Wales High Court - Case law on remote assessments	Grey <u>literature</u> : Case law	Revision of guidance on video assessments.	An AMHP must have “personally seen” the person Aligns with the Code of Practice in that direct personal

Author	Country	Title	Category	Focus	Findings
State for Health and Social Care					examination is the preferable method of examination through key phrases such as “personally seen” in s11(5) and “personally examined” in s12(1).
#339 BB v Cygnet Health Care Case Law (2015)	England	England and Wales High Court - Case law on relatives as interpreters	Grey <u>literature</u> : Case law	Inadequate consultation with Nearest Relative.	Questions the practice of an ASW (AMHP predecessor) of using a relative as interpreter
#16 Department of Health (2009)	UK (England)	Delivering Race Equality in mental health care: A review	Grey <u>literature</u> : Government report	Reports the work of the 5 year ‘Delivering Race Equality’ programme in England as it ends.	Provides an example of culturally appropriate services for psychosis acknowledging that some [people] revert to their own language to be able to express a particular thought or feeling and a second example of access to therapeutic services through use of interpreters. Neither are specific to MHA assessment.
#4 UK Government (2021)	UK (England and Wales)	Consultation outcome: Reforming the MHA	Grey: Government paper	Summary of Government proposals for review of MHA including policy and practice to improve the patient experience and a response to the independent review of the MHA.	Acknowledged some new ways of working since the pandemic including remote video consultation where appropriate and gives example of Second Opinion Doctor consultation. States Government’s wish to launch a programme of culturally appropriate advocates to better help those from all ethnic minority backgrounds to voice their individual needs but no specific mention of language or communication needs
#327 Care Quality Commission (2015)		MHA Code of Practice 2015 – An evaluation of how the Code is being used	Grey: Regulatory body report	Evaluation of how Code of Practice (Department of Health, 2015) is being used.	CoP is still not being used as intended and there is variation in provider understanding of it

Author	Country	Title	Category	Focus	Findings
					and how it should be used. Recommends development of standardised resources for patients, carers and staff, promoting the Code's principles of accessibility. Recommends learning from the Welsh Code of Practice's emphasis on evidence-based practice should underpin all learning.
#329 Care Quality Commission (2020)	England	Monitoring the Mental Health Act 2018/2019	Grey: national regulator report.	Annual audit of the use of the MHA reporting characteristics of those assessed, outcomes of assessment and data about the AMHP workforce.	No data are reported or required to be reported on the language(s) used during the MHA assessment, whether an interpreter, cultural advocate or any other language concordant professional was used. Ethnicity/cultural identity of the person assessed is recorded.
#333 Care Quality Commission (2022)	England	Monitoring the Mental Health Act in 2020/21	Grey: national regulator report.	Annual audit (update) of the use of the MHA reporting characteristics of those assessed, outcomes of assessment and data about the AMHP workforce.	No data are reported or required to be reported on the language(s) used during the MHA assessment, whether an interpreter, cultural advocate or any other language concordant professional was used. Ethnicity/cultural identity of the person assessed is recorded.
#337 Department of Health (2008)	England	Code of Practice Mental Health Act 1983	Grey: Government report	Statutory guidance for mental health professional in carrying out their duties and powers under the MHA 1983	Includes specific guidance on the requirement to interview 'in a suitable manner', allows for the provision of cultural advocates and relay interpreters, offers specific guidance with respect to <u>d</u> Deaf BSL users during

Author	Country	Title	Category	Focus	Findings
					assessments. Does not include any similar extended guidance for those who require a spoken language interpreter.
#326 Department of Health (2015)	England	Code of Practice Mental Health Act 1983	Grey: Government report	Statutory guidance for mental health professional in carrying out their duties and powers under the MHA 1983.	Includes specific guidance on the requirement to interview 'in a suitable manner', allows for the provision of cultural advocates and relay interpreters, offers specific guidance with respect to <u>d</u> Deaf BSL users during assessments. Does not include any similar extended guidance for those who require a spoken language interpreter.
#342 Welsh Assembly government (2008)	Wales	Code of Practice Mental Health Act 1983 for Wales	Grey: Statutory professional code of practice	Statutory guidance for mental health professional in carrying out their duties and powers under the MHA 1983 for Wales.	Includes specific guidance where a person's language is other than English or Welsh that assessment should be delivered through a trained interpreter who will address issues of both language and cultural interpretation, including use of BSL. If an interpreter is needed this should not normally be a relative or friend. Recommends support of an interpreter alongside an IMHA where there is a communication need.
#343 Welsh Assembly Government (2016)	Wales	Mental Health Act (1983) Code of Practice for Wales review	Grey: Statutory Code of Practice	Reviews the MHA 1983 Code of Practice for Wales – 2016 version.	'Every effort should be made' to provide a registered, qualified interpreter, if needed. Considers special expertise involved in interpreting thought-disordered language. Sets out professional and ethical principles for interpreters in MHAAs.

Author	Country	Title	Category	Focus	Findings
					Professionals should be aware immigration detainees may be particularly vulnerable and may need additional support, including reasonable adjustments including interpreter involvement.
#5 UK government (2018)	England and Wales	Modernising the Mental Health Act	Grey: Government initiated review report	Brings together and reports on the work of the Independent Review of MHA.	Finds that some service users may need assistance to express their views and preferences. Calls for more research into the lived experience of communities who are disproportionately detained. Refers to one AMHP's evidence of the experience of refugees and asylum seekers whose first language is not English.
#341 UK Parliament (2023) Joint Committee on the Draft Mental Health Bill	England	Draft Mental Health Bill 2022 - Report of the Joint Consultative Committee	Grey: Government report	Brings together work of the Joint Consultative Committee set up to review the draft mental health bill. Provides recommendations to the UK government.	Refers to one piece of oral evidence of the need to provide interpreters who understand cultural needs too but not followed up in recommendations.
#340 Department of Health and Social Care and Ministry of Justice of UK Government (2022)	England	Draft Mental Health Bill	Grey: Government report	Makes provision to amend and 'modernise' the MHA (1983).	No specific reference to interpreters.
#3 Smith (2021)	England and Wales	Government drops proposed overhaul of MHA-Mental Capacity Act interface due to 'very	Grey: Report in the professional press online General public	Reviews the (lack of) reform of MHA legislation.	Lack of support for change in MH legislation. Consequences: Remote assessments will continue to be unlawful (it does not clarify whether interpreting services

Author	Country	Title	Category	Focus	Findings
		limited support'			can be provided remotely). Concludes that further work on reforming the MHA must be conducted in particular to introduce legislation that addresses disproportionate detentions of individuals with BME backgrounds. Does not mention how language might contribute to those disparities.
#6 Carter (2021)	England and Wales	Video assessments by AMHPs unlawful	Grey: Report in the professional press online of a statutory review	Reports the outcome of a legal challenge to the Coronavirus easements that had permitted video, remote, online assessments under the MHA.	The 'Devon Ruling' concluded that the online remote video assessment under the MHA is unlawful. This ruling did not go as far to say any online interpreting without the interpreter being present is unlawful.
#334 NHS Digital (2002)	England and Wales	Government annual report	Grey	Reports the characteristics of those assessed under the MHA and reviews annual figures against previous years to identify trends.	No data are required to be reported on the language(s) used during the MHA assessment, whether an interpreter, cultural advocate or any other language concordant professional was used. Ethnicity/cultural identity of the person assessed is recorded.

## 5. Narrative synthesis of findings

We adopted the PAGER framework (Bradbury-Jones et al., 2022) to assist in the narrative synthesis of findings and their presentation. This tool was designed as a structured approach for synthesizing and articulating the findings of a scoping review. PAGER offers a clear structure whereby suggests that each item is considered under the headings of: 'Patterns', 'Advances', 'Gaps', 'Evidence for practice' and 'Recommendations', thus ensuring an

1  
2  
3 organised synthesis of the literature mapped out. ~~It~~ PAGER is especially suited to scoping  
4 reviews focusing on issues related to professional practice through its emphasis on  
5 identifying advances and gaps in the empirical and practice-oriented literature that require  
6 further research action. ~~The PAGER framework goes beyond merely identifying themes; it~~  
7 ~~closely considers the context in which themes might emerge, interact and from whose~~  
8 ~~perspective—hence identifying patterns.~~ The PAGER framework goes beyond merely  
9 identifying themes by meticulously examining the contextual factors that influence how  
10 themes emerge, interact, and are perceived from different perspectives. For a detailed  
11 methodological overview on how PAGER accomplishes this, please refer to Bradbury-Jones  
12 et al. (2022). ~~Additionally, it emphasises the implications of what is present and absent in the~~  
13 ~~literature for advancing practice.~~

18  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29 The full complete PAGER table can be found in Appendix 2 in the Supplemental Material  
30 alongside this article. The elements in this table assisted in the articulation of the main  
31 findings, set out below, where three main patterns concentrated around: (1) interpreter-  
32 mediated MHAAs as a missing focus; (2) implications of interpreting in statutory  
33 circumstances not being recognised; and (3) a lack of consideration of the impact of language  
34 mediation in contemporary AMHP practice. A descriptive narrative was constructed around  
35 these three main patterns to map out the key themes and represent their prominence in the  
36 literature. By articulating these patterns in detail, nuances highlighting advances or gaps in  
37 the field were identified, providing an overview of the current state of research and practice  
38 in interpreter-mediated statutory mental health assessments.

### 5.1. *Interpreter-mediated MHAAs as a missing focus*

1  
2  
3 A major finding of this review is that there- is the absence of pre-existing literature  
4 specifically investigating interpreter-mediated Mental Health Act assessments, or their  
5 international equivalents, regarding either practice or their impact on outcomes.  
6  
7  
8  
9  
10 ~~is no pre-existing literature available that specifically examines interpreter-mediated~~  
11 ~~MHAAs, nor with respect to international equivalents, whether in terms of practice or impact~~  
12 ~~on outcome.~~ The articles that have a broad focus on mental health interpreting do not  
13  
14  
15  
16  
17 generally include extensive, if any, references to involvement of interpreters in situations of  
18  
19 compulsory detention or emergency practice under the law. And even when such references  
20  
21 are made, they are usually brief and peripheral; for example, Tribe and Lane's (2009)  
22  
23 reference to duties to provide linguistically accessible information to those detained. Articles  
24  
25 focussing on issues of AMHP practice, for example, Leah (2019), Vicary, et al. (2019),  
26  
27 Abbot (2021), Karban, et al. (2021) fail to include any consideration of how linguistic or  
28  
29 cultural mediation might be relevant to their key findings. The absence of research evidence  
30  
31 with a specific focus on the practice of interpreter-mediated MHAAs creates a misleading  
32  
33 perception that all MHAAs take place within a monolingual context with shared language  
34  
35 usage.  
36  
37  
38  
39

40  
41 The failure to recognise the effects and potential influence of language on MHAA practice  
42  
43 and outcomes, separate from those of cultural and/or ethnic identity, is widespread. The lack  
44  
45 of annual-regular reporting data on the language identities and language use of those assessed  
46  
47 (NHS Digital, 2022a), and whether interpreters or other language concordant professionals  
48  
49 were required is stark. It could be argued that this illustrates a lack of emphasis on  
50  
51 considering the language preferences of the person being assessed and the assessment process  
52  
53 as potential sources of inequality within the MHA assessment process.~~It could be argued that~~  
54  
55 ~~this demonstrates how little value is given to the language of the person and the assessment as~~  
56  
57 ~~potential axes of inequality within the MHAA process.~~ This failure to attend to language  
58  
59  
60

1  
2  
3 differences is reinforced in the literatures surrounding the reforms to the MHA with language  
4 considerations only featuring with respect to translations of written texts/information for  
5 patients or special considerations for those who are deaf (UK Parliament, 2023). In the most  
6 recent report from the Joint Consultative Committee on the Draft Mental Health Bill (2023),  
7 the body set up to scrutinise the draft mental health bill, the brief mentions of interpreting are  
8 subsumed under considerations of advocacy for the person assessed, rather than identified in  
9 their own right (UK Parliament, 2023).

10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20 The diminishment of the potential influence of interpreter -mediation on the practice and  
21 outcomes of MHAAs is systemic. For example, the ~~easements temporary allowances~~ under  
22 the Coronavirus Act 2020 in the UK that briefly permitted remote MHAAs were eventually  
23 judged unlawful in part because of the negative impact on judgements, interaction and  
24 communication (see NHS England, 2022). Remote interpreting is still widely practiced in  
25 MHAAs (Young et al., 2023). However, the impact of a ‘disembodied voice’ during an  
26 assessment on someone already experiencing mental health distress, which could result in the  
27 deprivation of liberty, remains unquestioned: Why are questions regarding the legality of  
28 remote assessments not being extended to remote interpreting? -Why would the unlawfulness  
29 associated with whether an assessment can be correctly carried out remotely under the MHA  
30 not also apply to the circumstances of remote interpreting? This is an area of practice  
31 research that clearly requires further work. The gap in the evidence-based practice literature,  
32 practice guidance and statutory reporting is, ~~however, not confined to the UK not limited to~~  
33 the UK alone. ~~This~~ lack of attention extends internationally ~~and thus, the scarcity of~~  
34 research directly in this area is of global concern, making the scarcity of research directly in  
35 this area a matter of global concern.

36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57 A second aspect related to ‘interpreter-mediated MHAAs as a missing focus’ concerns the  
58 characteristics of the available literature and the clear scarcity of empirical studies relating to  
59  
60

1  
2  
3 interpreter mediation in MHAAs and their equivalents. Empirical research plays a vital role  
4  
5 in advancing knowledge and the absence of it limits the ability to draw evidence-based or  
6  
7 evidence-informed recommendations for practice. While numerous guidance documents, both  
8  
9 statutory and non-statutory, emphasise the need for best practices, including proper  
10  
11 assessments as required by legislation, the preference for professionally qualified interpreters,  
12  
13 and the duty to make provisions for them (ASLIA, 2011; Carney, 2021; Department of  
14  
15 Health, 2015, Department of Health, 2008; Hlavac, 2017; Welsh Assembly Government,  
16  
17 2008), these documents do not constitute an evidence base for practice, neither for  
18  
19 interpreters nor for AMHPs.  
20  
21  
22

### 23 24 *5.2 The implications of interpreting in statutory circumstances not being recognised*

25  
26  
27 The findings of this review suggest that the prevailing body of research in interpreting studies  
28  
29 does not adequately distinguish research, guidelines or practice recommendations that apply  
30  
31 in mental health statutory contexts, such as the MHA, from general work on interpreting in  
32  
33 mental health. Most of the literature available refers to interpreter-mediated in  
34  
35 psychotherapeutic (Bot, 2015) or psychiatric (Drennan and Swartz, 2002; Wand, 2020)  
36  
37 practice whether in assessment, evaluation or treatment and therefore does not recognise  
38  
39 distinctive issues at stake in statutory assessments. This applies both to empirical studies and  
40  
41 professional guidelines. Some of the issues prevailing in existing mental health interpreting  
42  
43 literature include (i) the interpreters' role, agency and visibility including ethical dilemmas in  
44  
45 relation to those, (ii) links between language, culture, and mental health, (iii) challenges  
46  
47 around ensuring accuracy in mental health, e.g., in the case of cross-cultural equivalents, (iv)  
48  
49 the impact of language mediation on mental health practice including assessments and (v)  
50  
51 interpersonal dynamics. In the literature reviewed, none of these issues is addressed in the  
52  
53 context of MHAAs and the special conditions that may pertain to emergency or statutory  
54  
55 practice under the law. As a result, this scoping review highlights the need for research that  
56  
57  
58  
59  
60

1  
2  
3 explores how long-standing debates and current expertise in the field of interpreting studies,  
4 particularly mental health interpreting, apply to statutory mental health assessments and, by  
5 extension, to other statutory practices. ~~This~~ Such research would lead to generating new  
6 insights and perspectives on the topic which would, in turn, advance the field of interpreting  
7 studies. ~~This~~ The contribution of this area of work to interpreting studies lies in the unique  
8 challenges presented by interpreting within statutory mental health ~~because interpreting in~~  
9 ~~the context of MHAAs presents distinct challenges that necessitate specialised attention~~, such  
10 as interpreting complex legal terminology, the role, responsibilities and powers of  
11 professionals conducting MHAAs, and the interpreting of potentially disordered language  
12 output of people severely affected by mental health conditions, all within the context of  
13 potential involuntary detention under the law.

14  
15 This lack of recognition of the particular nature of mental health interpreting in relation to  
16 statutory mental health contexts such as MHAAs is also present in existing guidance for  
17 interpreters. Some do mention special legal considerations and associated concepts, or ethical  
18 considerations that might be pertinent to MHAAs (ASLIA 2011; 2020; Hlavac, 2017),  
19 however, they do not comprehensively address the unique considerations, procedures, and  
20 challenges encountered in statutory mental health assessment under whatever jurisdiction.  
21 The absence of detailed guidance for interpreters in situations of mental health crises and  
22 collaboration with professionals under legal obligations poses a challenge. The scarcity of  
23 explicit practice frameworks may impact interpreters, ~~influencing their~~ given that there is not  
24 sufficient guidance to support their decision-making in this context ~~performance~~ and thus  
25 compromising the overall quality of the assessment process, particularly in relation to legal  
26 aspects. Additionally, the lack of existing literature raises concerns regarding the preparation,  
27 training, and support provided to interpreters working in statutory mental health contexts,  
28 including the absence of these matters within generic interpreter training programmes.

Building on this point, when discussing the need for interpreters to have knowledge and skills that extend beyond conventional interpreting competencies to effectively work in specialised mental health contexts, it is worth acknowledging recent developments in the area of trauma-informed interpreting. This approach calls for recognition of the impact of trauma on individuals' behaviour and linguistic output, including thought-disordered language, and encourages interpreters to apply trauma-informed principles to their work (Bancroft, 2017; González-Campanella, 2022).

This scoping review also identified a lack of literature on the need for collaborative working practices between AMHPs (or equivalents) and interpreters in MHAAs (or equivalents). This is important because there is some evidence (from non-statutory mental health services) to suggest that interprofessional collaboration between mental health practitioners and interpreters can lead to positive outcomes (Gryesten et al., 2023). However, there is a gap in the existing literature on the specific strategies and techniques that AMHPs and interpreters can use to effectively collaborate during MHAAs, in which the legal aspect is especially salient. Moving beyond academic literature and guidelines, statutory documents paint a similar picture: while the statutory code of practice accompanying the MHA (Care Quality Commission, 2015; Department of Health, 2008 Department of Health, 2015, Welsh Assembly Government, 2008, Welsh Assembly Government, 2016) does offer certain guidance regarding ~~the~~ situations that call for the involvement of an interpreter, it falls short of providing specific instructions on how AMHPs can effectively collaborate with interpreters. The existing guidance primarily focuses on determining when interpreter assistance is required, rather than offering specific guidance on optimising the working relationship between AMHPs and interpreters. The ~~potential dissonance~~ lack of guidance that AMHPs may experience when conducting assessments through an interpreter, assumptions that might be made regarding ~~the~~ interpreters' level of knowledge about core legal concepts

1  
2  
3 and their implications, for instance, will require carefully considered practice responses.  
4  
5 Guidance that supports AMHPs to jointly navigate the complexities of meaning making in  
6  
7 MHAAs as opposed to viewing interpreting as a bolt-on mechanism, or a 'conduit', would  
8  
9 not only enhance AMHP confidence in interviewing 'in a suitable manner' and reaching a  
10  
11 decision on outcomes, but would also have associated benefits for the experience of people  
12  
13 assessed.  
14  
15

### 16 17 18 *5.3 Lack of consideration of impact of language mediation in contemporary AMHP practice* 19

20  
21 The parameters of the scoping review include available empirical research on the challenges  
22  
23 involved in AMHPs' professional practice, in order to identify the extent to which challenges  
24  
25 associated with language mediation might be recognised. It was notable to find that  
26  
27 challenges associated with the need for language mediation have been largely overlooked in  
28  
29 the existing body of research that focuses on contemporary AMHP practice.  
30  
31

32  
33 The current literature predominantly focuses on various challenges that AMHPs encounter in  
34  
35 their work, such as effectively managing risks (Simpson, 2020), navigating complex legal  
36  
37 frameworks (Abbott, 2021; Fish, 2022), safeguarding the rights and autonomy of individuals  
38  
39 undergoing assessment and rights of the Nearest Relative (Dixon et al., 2019), and fostering  
40  
41 collaborative relationships with other professionals during the coordination of MHAAs  
42  
43 (Davidson et al., 2021). These studies shed light on AMHPs' awareness of the ethical  
44  
45 dilemmas inherent in wielding statutory powers, including striking a balance between  
46  
47 autonomy and safety, managing power dynamics, managing the complexities of their  
48  
49 coordinating role, and grappling with time constraints.  
50  
51

52  
53  
54 It was notable that in all these studies, which admittedly had a different focus than our topic  
55  
56 of interest, there was not even a passing consideration given to whether and how the points  
57  
58 being made might be impacted by practice that is not monolingual. This absence is  
59  
60

1  
2  
3 remarkable given that previous research has found that language mediation might challenge  
4 standard communicative practices in social work in ways that practitioners do not have the  
5 resources to address affectively (Tipton, 2016). The specific challenges faced by AMHPs in  
6 such interpreter-mediated assessments are multifaceted. The presence of interpreters  
7 introduces a layer of complexity for AMHPs that can impact the accuracy and reliability of  
8 information exchanged. A higher potential for misinterpretations, omissions, or  
9 misunderstandings can occur, potentially compromising the overall assessment process and  
10 subsequent decision-making. This is particularly salient in the case of acute mental health: for  
11 example, the MHA Code of Practice (Section 14.116-117), states that the AMHP involved in  
12 the assessment should be responsible for booking and using registered qualified interpreters  
13 with expertise in mental health interpreting, bearing in mind that the interpretation of  
14 thought-disordered language requires “particular expertise”. However, the specific skills and  
15 expertise required to effectively interpret thought-disordered language, particularly in the  
16 context of an MHAA, are not thoroughly examined in the existing body of knowledge.  
17 Thought-disordered language, ~~often~~ occasionally observed in individuals with severe mental  
18 health conditions (Caplan, 2009), is likely to pose unique challenges for interpreters because  
19 of the complex and sometimes fragmented nature of the language use. Understanding and  
20 accurately conveying the meaning and intent of such language calls for specialised expertise  
21 that goes beyond general language interpretation skills and beyond generic AMHP training.  
22 However, the literature lacks comprehensive exploration of the specific competencies,  
23 training, and qualifications that interpreters and AMHPs need to possess in order to jointly  
24 address thought-disordered language within the context of MHAAs. By addressing this gap in  
25 the literature, further research could expand on the practical implications of the MHA Code  
26 of Practice’s provisions related to interpreter selection and utilisation with a focus on  
27 effective collaborative practice.

59  
60

1  
2  
3 Whilst some of the AMHP-related practice research focuses on power inequalities in  
4 MHAAs (Buckland, 2020), this is only considered in monolingual contexts, which itself is  
5 not acknowledged in the literature. The AMHP, as the primary decision-maker in the  
6 assessment, is identified as holding a position of power. However, ~~the circumstance of~~ how  
7 the presence of an interpreter introduces an additional layer of complexity to the assessment  
8 process, influencing the distribution of power among the various participants involved,  
9 remains unaddressed. This is important because power is connected to the notion of 'voice',  
10 understood to mean the expression of one's wishes and feelings and that might have an  
11 influence on a person's mental state and behaviour. In the context of MHAAs, a crucial  
12 aspect of the AMHPs' responsibility is to distinctly discern, in adherence to legal mandates,  
13 the options aligned with the principle of the 'least restrictive alternative' during the  
14 assessment process. Interpreter-mediation introduces an additional layer of communication  
15 that either enables or constrains the service user's voice and how it might be understood.  
16 Surprisingly, this crucial aspect has not been comprehensively explored in the existing  
17 literature concerning one of the most profound civil law powers, which allows the deprivation  
18 of an individual's liberty. Attention to the availability and proficiency of interpreters and the  
19 challenges these pose for AMHPs is also absent. This is salient because, in accordance with  
20 the MHA Code of Practice, AMHPs are responsible for organising interpretation. AMHPs are  
21 also charged with engaging with an assessed person's Nearest Relative to ascertain whether  
22 they have an objection to the person's detention under the MHA. The available literature that  
23 discusses this role does not mention any complexities that might arise if the AMHP and  
24 Nearest Relative or wider family do not share the same language (Dixon et al., 2019;  
25 Hemmington et al., 2021). However, previous research on social work with interpreters has  
26 identified difficulties that social workers might have in liaising with families of service users  
27 who use a language other than English, even when interpreters are involved (Pollock, 2023).

## 17 **6. Concluding remarks**

20 This scoping review set out to answer two research questions about the state of knowledge  
21 concerning interpreter-mediated statutory mental health assessments, specifically MHAAs.  
22  
23 The first question concerned the enablers and barriers to good practice ~~including their~~  
24 ~~international equivalents~~ for AMHPs and interpreters in MHAAs. The main finding of this  
25 review is the almost total absence of the consideration of interpreter-mediated in empirical  
26 research on MHAAs and the lack of evidence-based guidance for practice ~~are the biggest~~  
27 ~~barriers~~. Building on this idea, the absence of evidence highlights the potential catalysts for  
28 improving practice. ~~This includes which may include~~ a focus on fostering collaborative  
29 interprofessional teamwork, ~~which could involve joint training for AMHPs and~~  
30 ~~interpreters jointly involving interpreters and mental health professionals~~. Additionally,  
31 exploring how and why the unique circumstances of statutory work within the mental health  
32 field may differ from conventional mental health interpreting practice is essential. Finally, it  
33 is crucial to examine how key considerations in AMHP practice, such as power dynamics and  
34 voice, can adapt to, or be influenced by, the additional layer of working with interpreters.  
35  
36  
37  
38

42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53 The second question for this review set out to explore how interpreter-mediated supports or  
54 impedes the legal rights and best interests of individuals assessed under the MHA or its  
55 international equivalents. Our principal finding is that none of the literature items we  
56 identified actually addressed this as an issue in its own right beyond guidance of when  
57  
58  
59  
60

1  
2  
3 interpreters should be provided, and the rights of the individual to have access to high-quality  
4 interpretation. There is no direct evidence from practice and no clarity that evidence from  
5 related contexts, including mental health interpreting more generally, is adequately relevant  
6 to the very particular practice circumstances of MHAAs.  
7  
8  
9  
10  
11

12  
13 When considering the characteristics of the literature items identified, an unanticipated  
14 finding is the lack of transdisciplinary approaches across the fields of interpreting studies and  
15 health/social care in this context. This literature review has brought together relevant  
16 literature items from the fields of social work and interpreting studies that address  
17 overlapping points in the context of MHAAs or equivalents. By synthesising the insights  
18 from both disciplines, this review sought to highlight the interconnections and shared  
19 perspectives that can contribute to a more comprehensive understanding of interpreter-  
20 mediated MHAAs. The findings suggest that while both fields have valuable perspectives to  
21 offer, both bodies of knowledge appear to operate separately. The lack of cross-fertilisation  
22 hinders the development of a comprehensive understanding and approach to interpreter-  
23 mediated MHAAs. This gap in interdisciplinary research likely points to limited opportunities  
24 for interprofessional collaboration and training. Social workers and interpreters typically  
25 work in separate organisational structures, with little opportunity for collaboration or joint  
26 training. This can result in social workers and interpreters having limited knowledge of each  
27 other's roles and responsibilities, leading to potential misunderstandings and challenges in  
28 completing effective MHAAs or failing-failure to conduct them in a suitable manner.

48

49 This review marks the initial phase of the INForMHAA project and serves as the  
50 foundational step toward addressing the identified gap in practice-based research and aims to  
51 offer tailored guidance and training resources for AMHPs and interpreters in this field. This  
52 review makes several contributions to interpreting studies: it draws attention to a highly  
53 specialised area of mental health interpreting; it exemplifies the value of value of scoping  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 reviews in cross-disciplinary studies on interpreting; it encompasses both signed and spoken  
4 language interpreting within a common focus of inquiry and it lays the groundwork for a  
5 systemic exploration of this topic in different national contexts, thereby facilitating future  
6 cross-national comparisons across countries with different legislative frameworks and  
7 healthcare systems, and thus increasing understanding on mental health interpreting practices  
8 globally.

9  
10  
11 Having acknowledged its contribution, it is also important to recognise the limitations of this  
12 scoping review to guide future reviews on interpreter-mediated statutory mental health  
13 assessments or similar topics. For instance, the breadth-over-depth approach of this scoping  
14 review means that nuanced aspects of interpreter-mediated MHAAs may have been  
15 overlooked. Additionally, an exhaustive quality assessment of the selected items was not  
16 provided, potentially limiting the ability to critically evaluate the quality of the evidence base.  
17 Addressing these limitations could enhance the robustness of future literature reviews in this  
18 field or similar ones.

34  
35  
36  
37  
38 This review is the first stage in a comprehensive research project on interpreter-mediated  
39 MHAAs that will start to fill the gap in practice-based research we have identified and  
40 provide highly specific guidance and training resources in this challenging field of practice  
41 for both AMHPs and interpreters. It makes several important contributions to interpreting  
42 studies: it draws timely attention to a highly specialised area of mental health interpreting; it  
43 exemplifies the value of scoping reviews in cross-disciplinary studies on interpreting; it  
44 addresses signed and spoken language interpreting in a single approach, and by focusing on a  
45 single national context, it lays the foundations for a systematic approach to the topic in other  
46 national contexts, thereby facilitating future cross-national comparisons.
